

# **Nuclear structure study for the neutron-rich nuclei beyond $^{132}\text{Sn}$**

He Wang

RIKEN Nishina Center

# Content

➤ Motivation

➤ Experiment

➤ Results on the first  $2^+$  states in  $^{136}\text{Sn}$  and  $^{132}\text{Cd}$

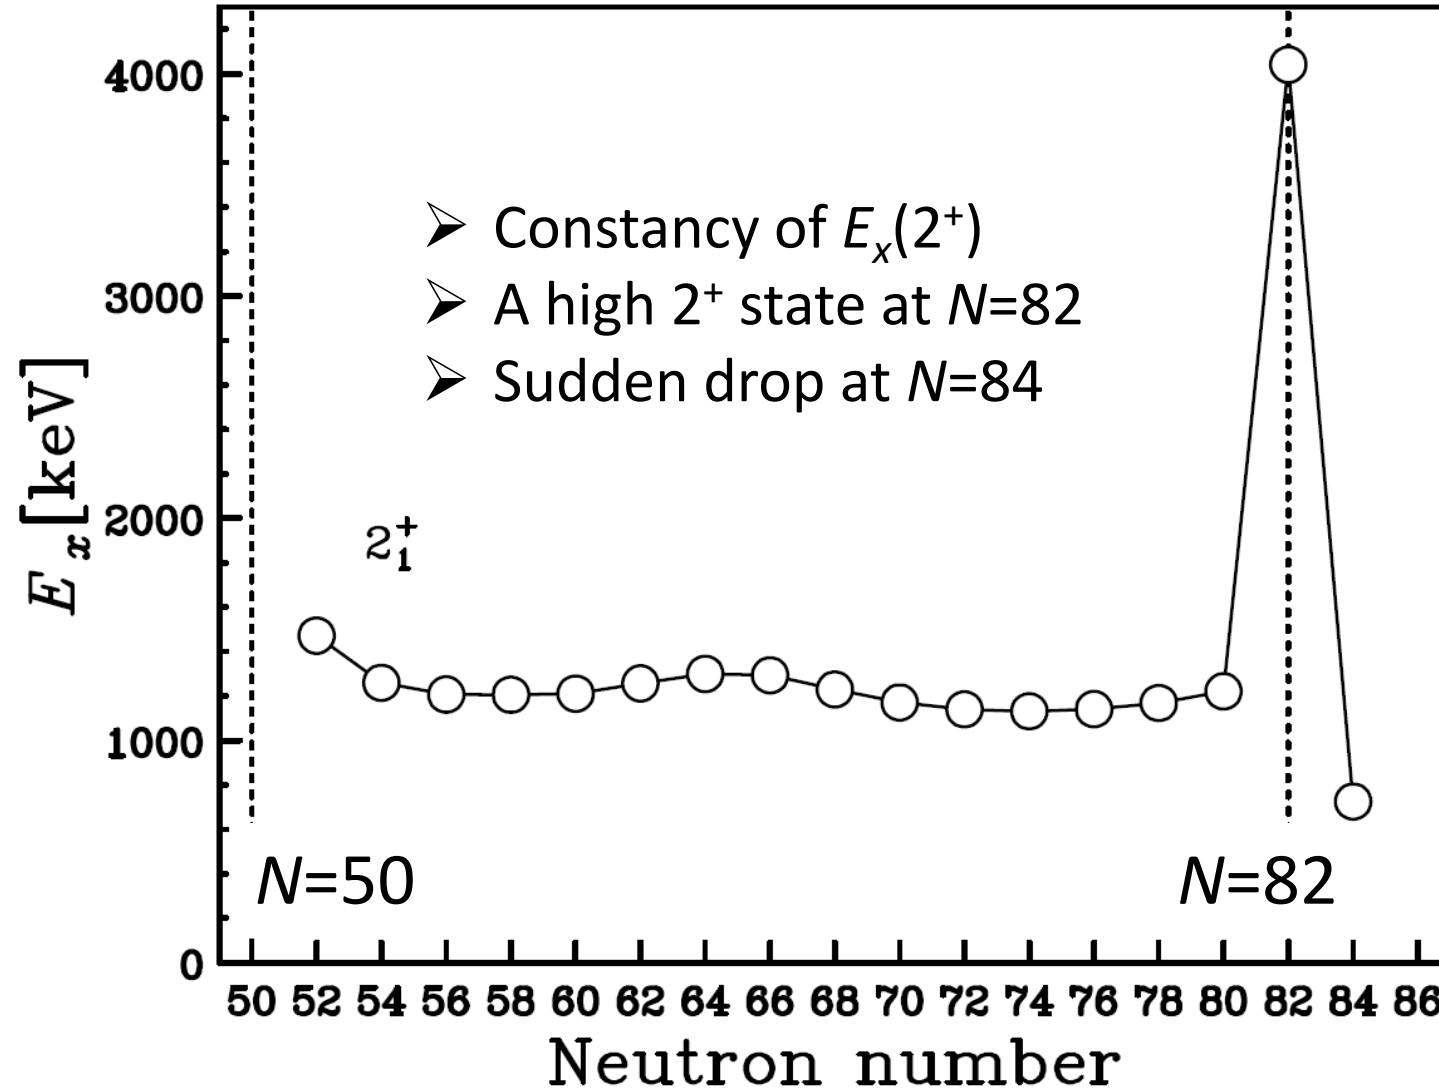

➤ Summary

# Motivation I

# Motivation I

Interesting phenomena in  $E_x(2^+)$

# Studying region

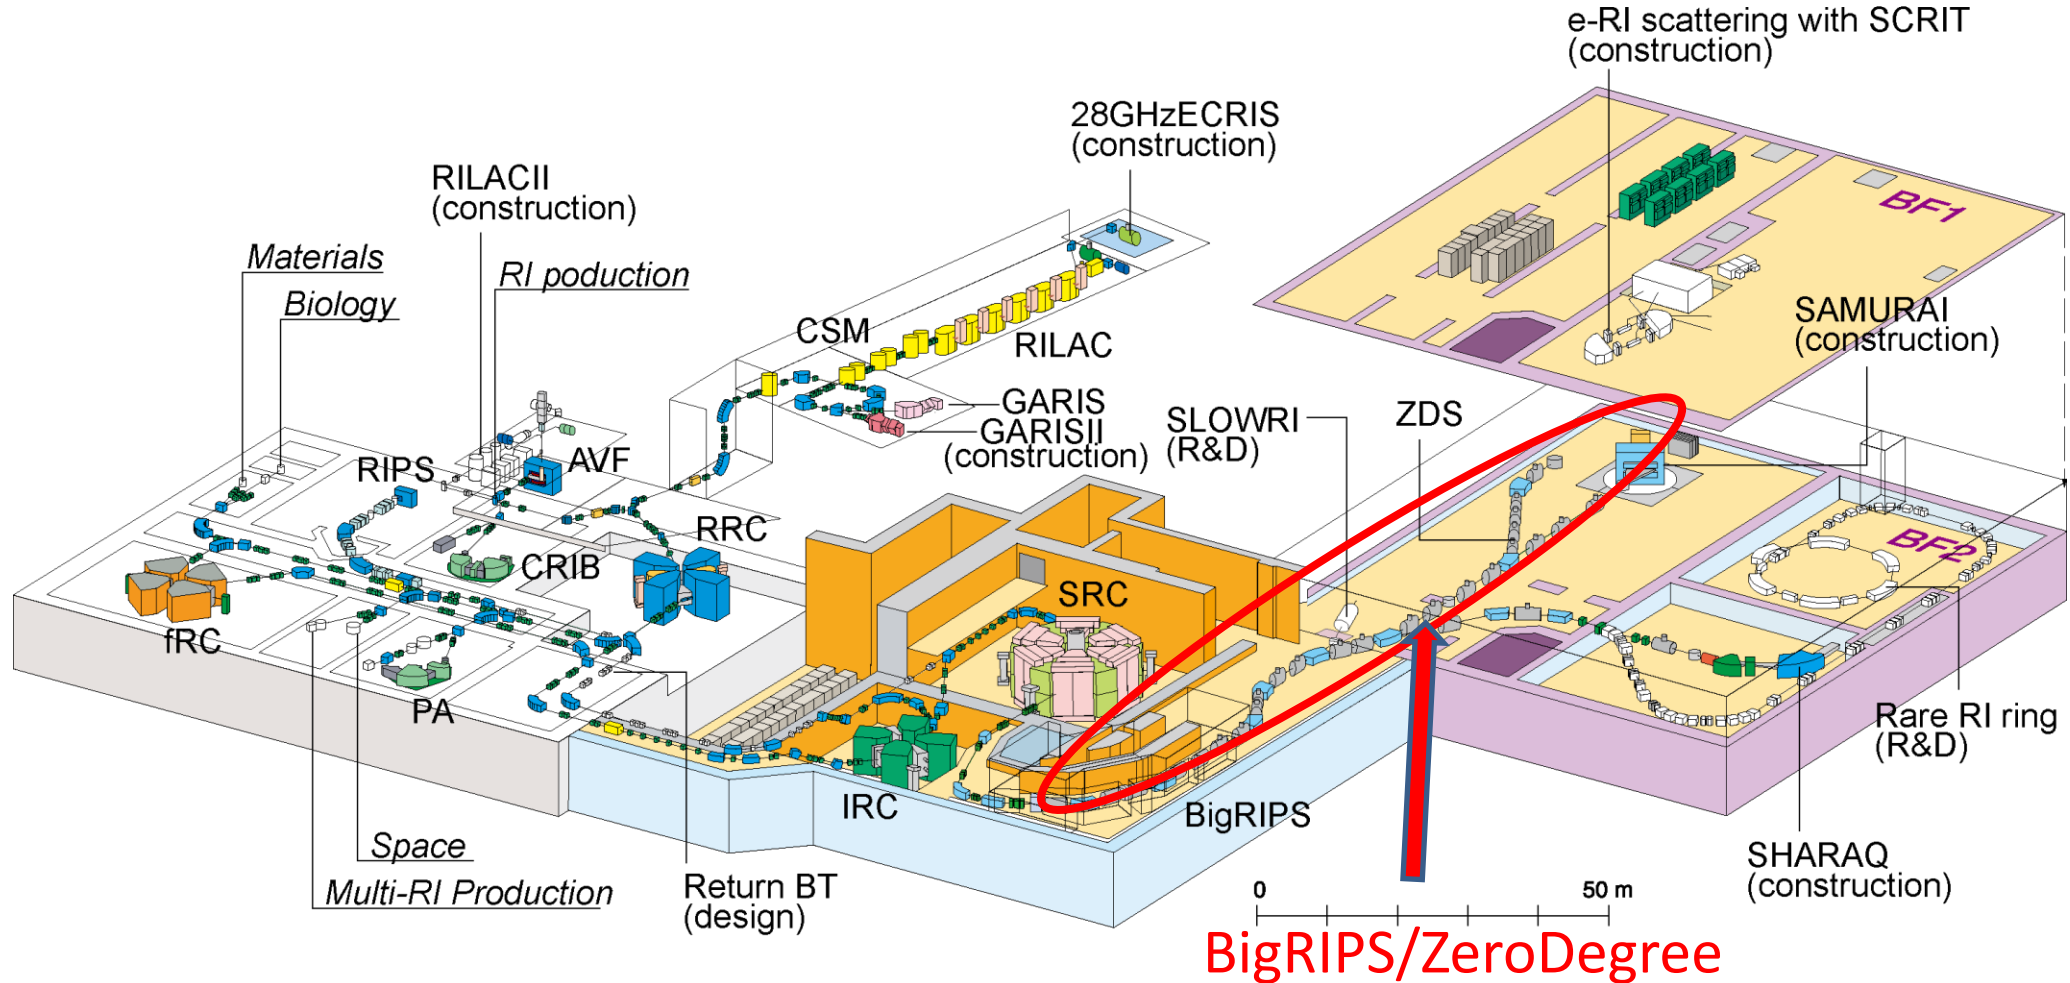

# Experimental method

- One- and two-proton removal reactions following fission of U  
-- to access the exotic neutron-rich nuclei
- In-beam gamma-ray spectroscopy  
-- to identify the low-lying excited states

# Experiment

## Radioactive Isotope Beam Factory : BigRIPS and ZeroDegree

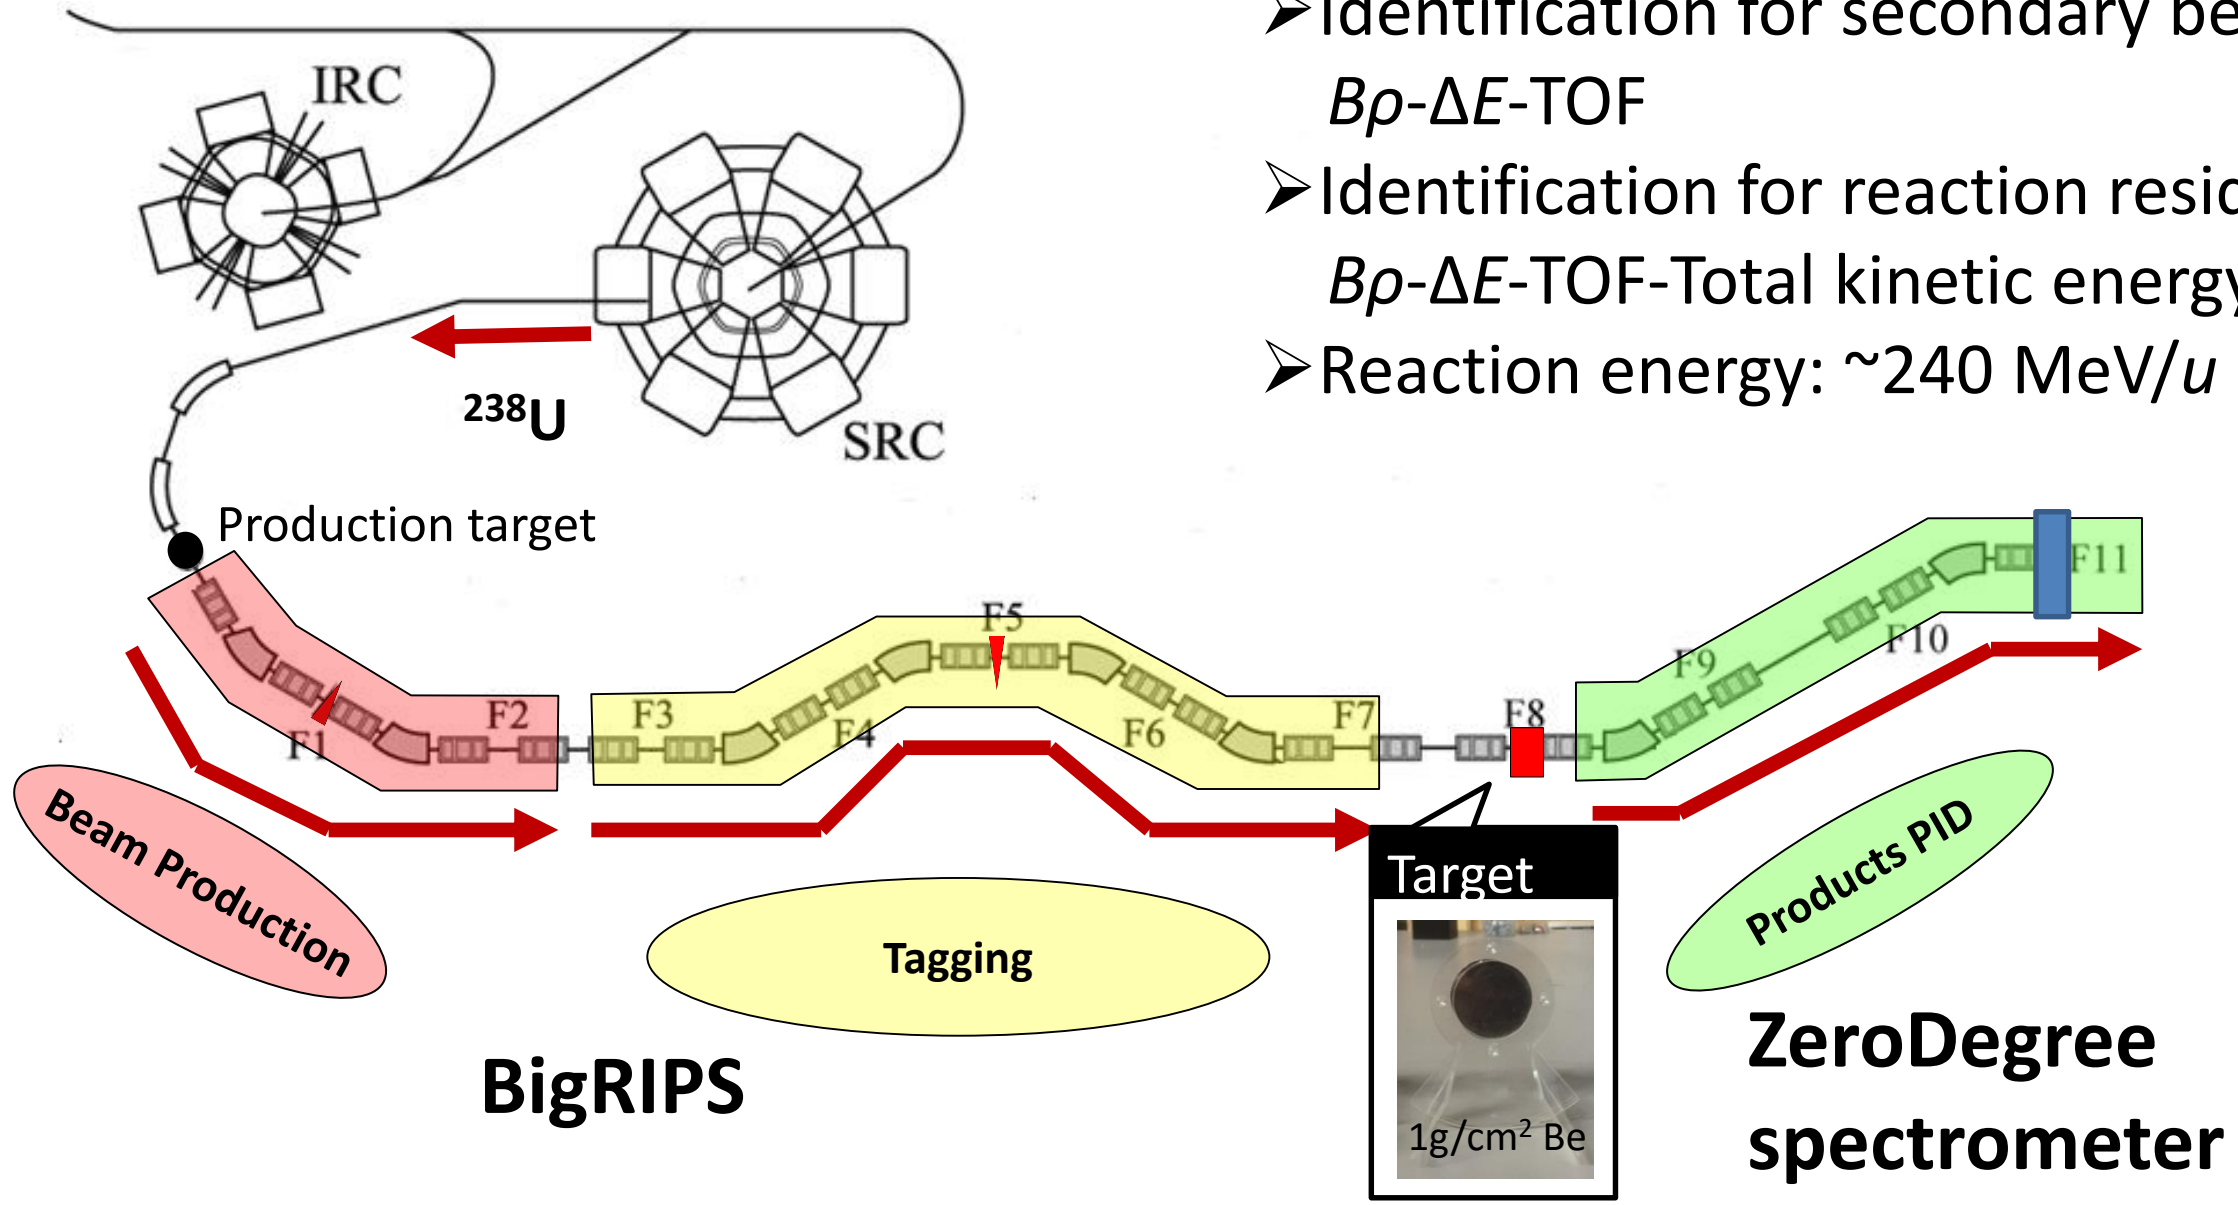

# Experimental setup

Superconducting Ring Cyclotron (SRC)

# Experimental setup

- Identification for secondary beams  
 $B\rho$ - $\Delta E$ -TOF
- Identification for reaction residues  
 $B\rho$ - $\Delta E$ -TOF-Total kinetic energy
- Reaction energy:  $\sim 240$  MeV/u

# Experimental setup

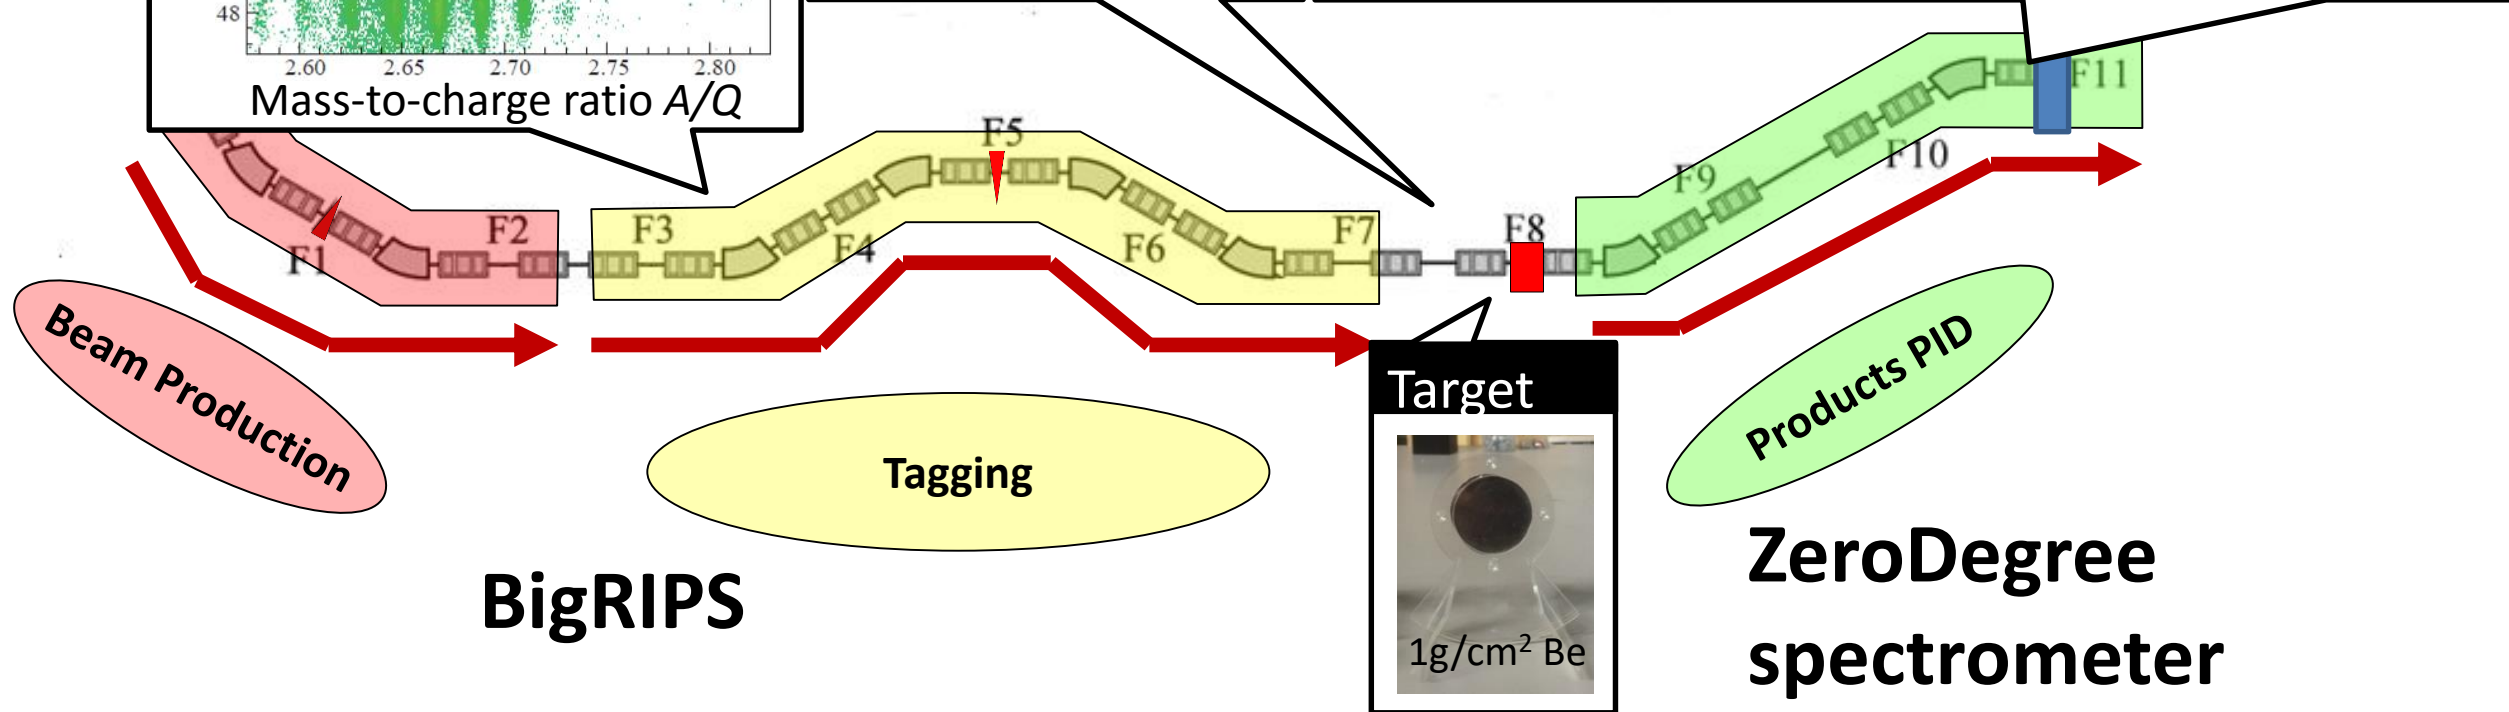

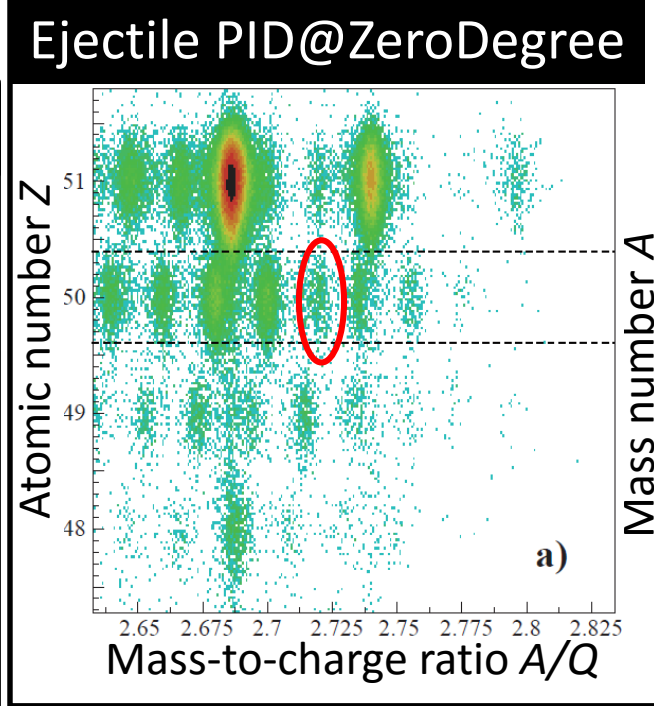

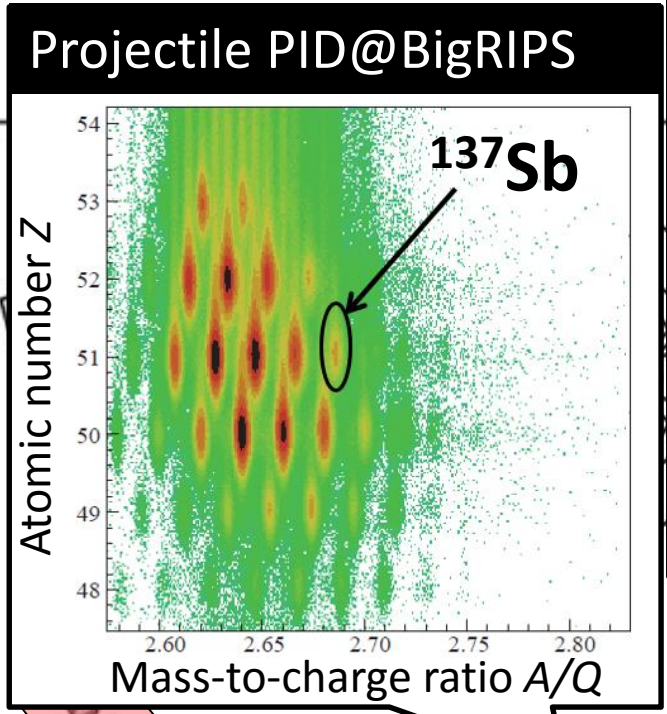

# DALI2 array

186 NaI(Tl) detectors

# Results

# The first $2^+$ state in $^{136}\text{Sn}$

One-proton removal reaction

# Systematics of $E_x(2^+)$

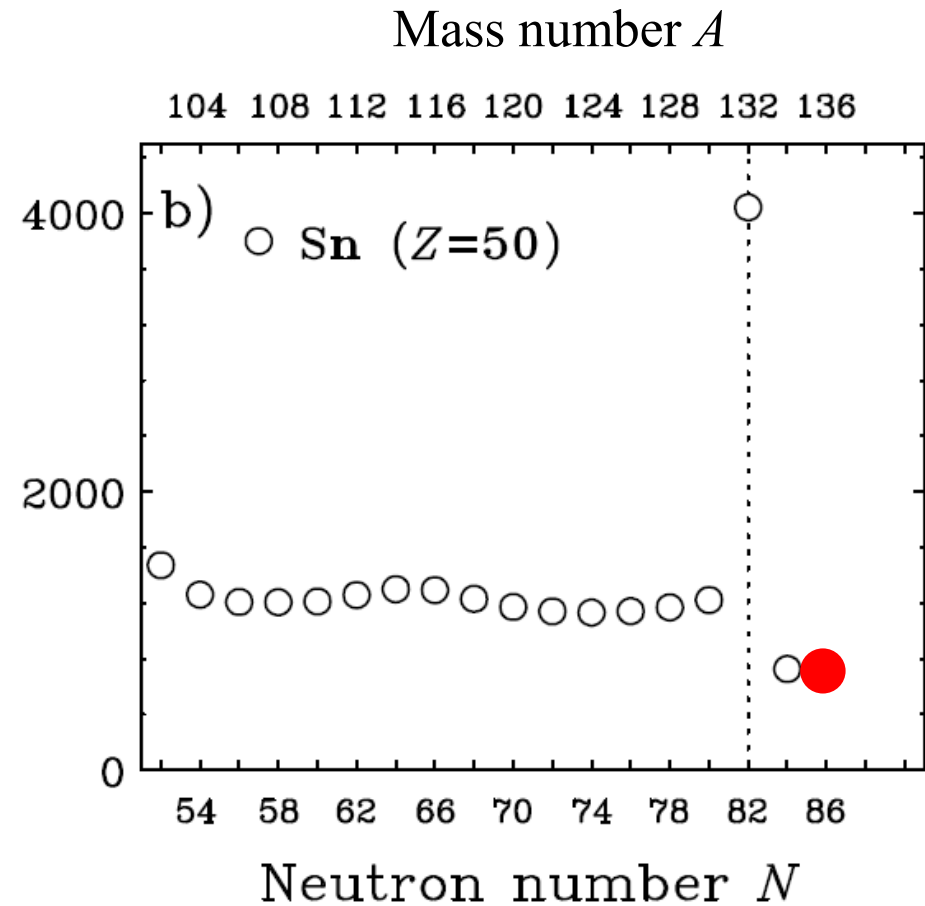

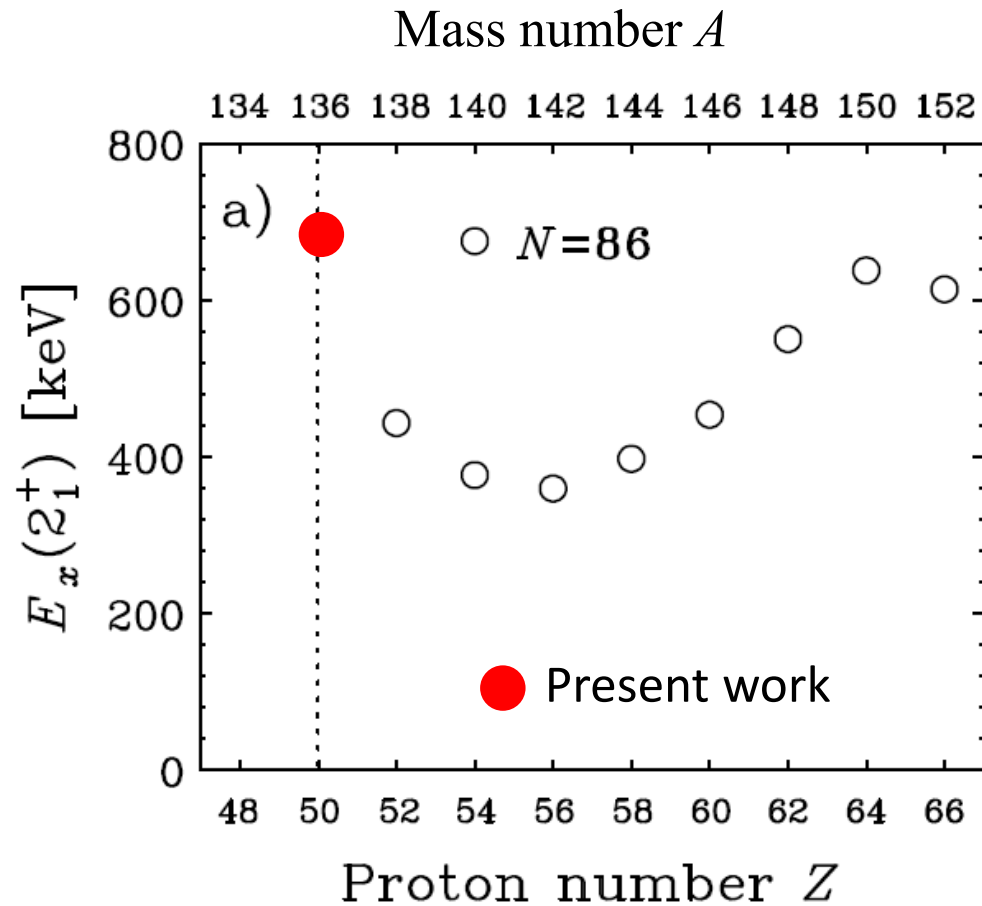

- $Z = 50$  magicity in  $N = 86$  isotones
- Constant  $E_x(2^+)$  beyond  $N = 82 \rightarrow$  Seniority scheme
- Asymmetric  $E_x(2^+)$  pattern around  $N = 82$

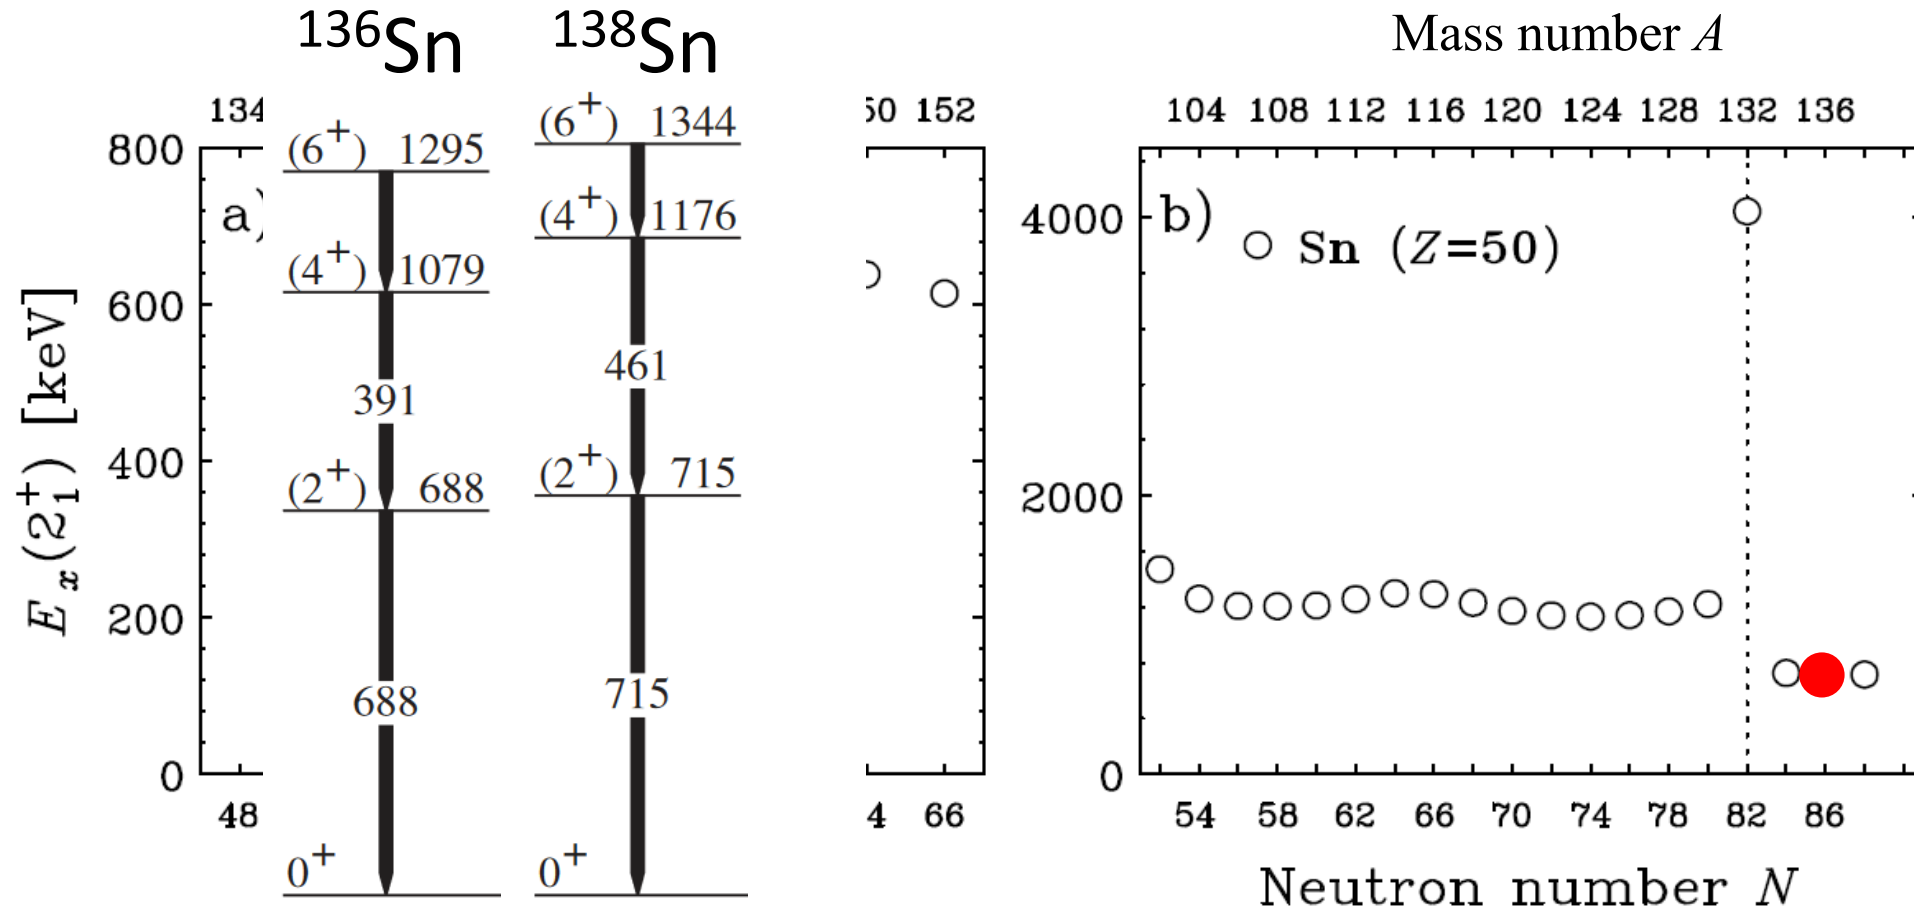

# Systematics of $E_x(2^+)$

- $Z = 50$  magicity in  $N = 86$  isotones
- Constant  $E_x(2^+)$  beyond  $N = 82 \rightarrow$  Seniority scheme
- Asymmetric  $E_x(2^+)$  pattern around  $N = 82$

# Systematics of $E_x(2^+)$

- $Z = 50$  magicity in  $N = 86$  isotones
- Constant  $E_x(2^+)$  beyond  $N = 82 \rightarrow$  Seniority scheme
- Asymmetric  $E_x(2^+)$  pattern around  $N = 82$

# Systematics of $E_x(2^+)$

- $Z = 50$  magicity in  $N = 86$  isotones
- Constant  $E_x(2^+)$  beyond  $N = 82 \rightarrow$  Seniority scheme
- Asymmetric  $E_x(2^+)$  pattern around  $N = 82$

# Possible reason

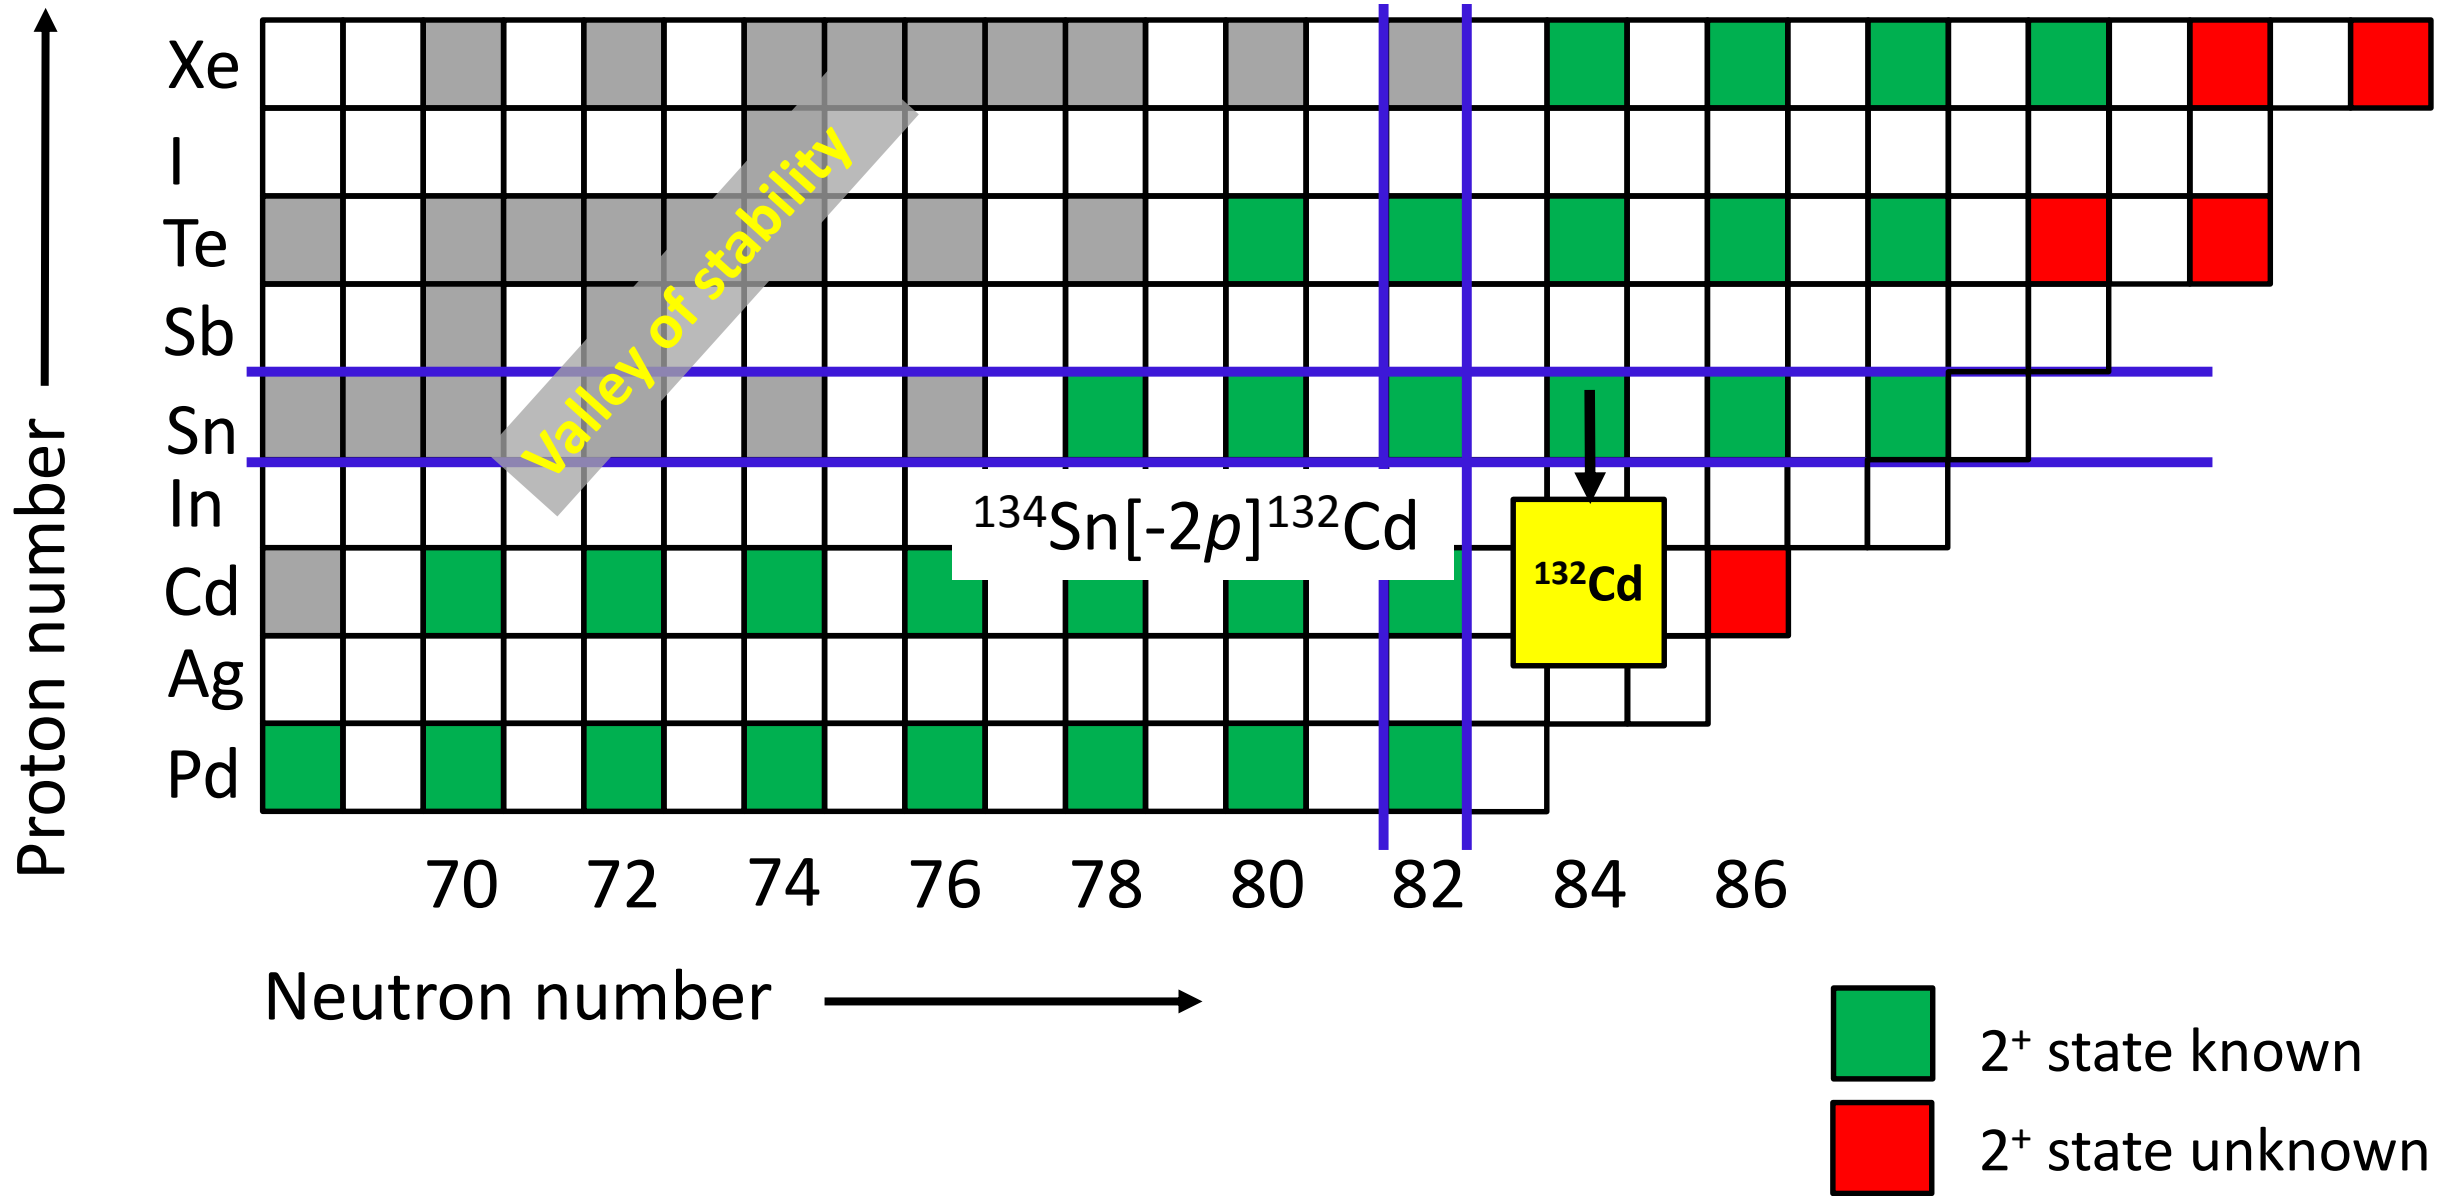

Reduction of pairing?

$\leftarrow E_x(2^+)$  is determined by the strength of pairing

$$\Delta^{(3)}(N) = (-1)^N [B(N-1) + B(N+1) - 2B(N)]/2$$

# Results

# Summary

- Nuclear structure study for the nuclei beyond  $^{132}\text{Sn}$   
One- and two-proton removal  
In-beam gamma-ray spectroscopy
- First  $2^+$  state in  $^{136}\text{Sn}$   
Seniority scheme holds beyond  $N = 82$  and asymmetric  $E_x(2^+)$  pattern
- First  $2^+$  state in  $^{132}\text{Cd}$
- Neutron pairing reduction beyond  $N = 82$
- Future experimental study in this region  
Mass measurement,  $B(E2)$
