

Winter Nuclear and Particle Physics Conference 2018

HV Isolation of ITk Sensors

Konstantin Lehmann

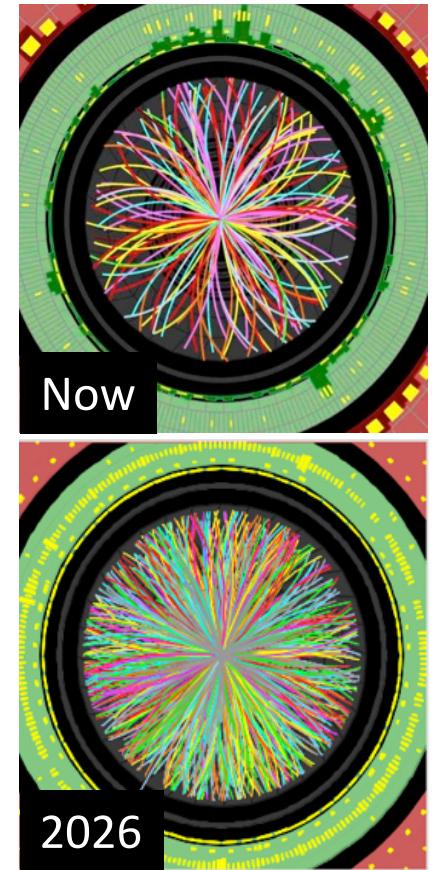

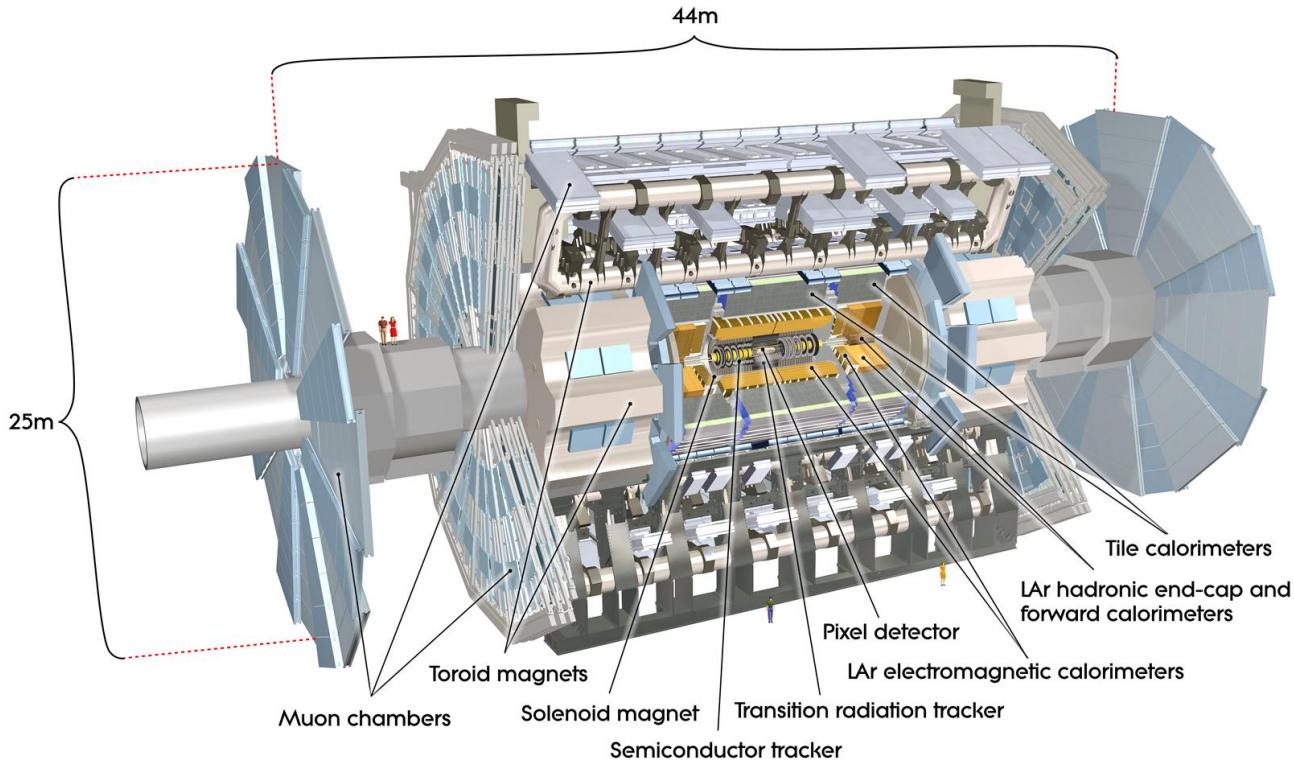

Faculty of Science, Simon Fraser University

February 15th, 2018

ATLAS at CERN

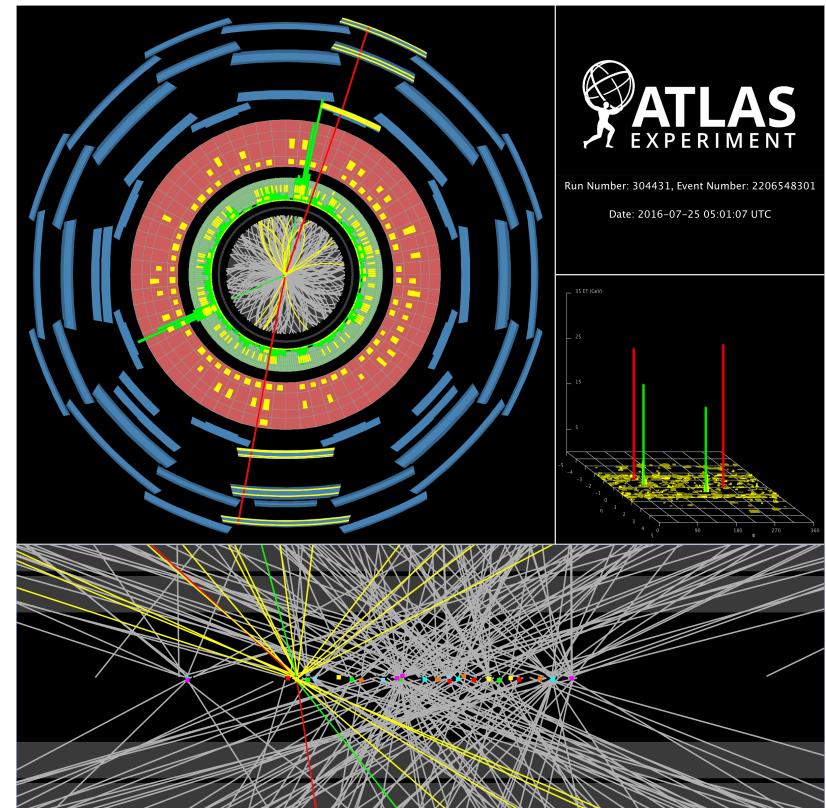

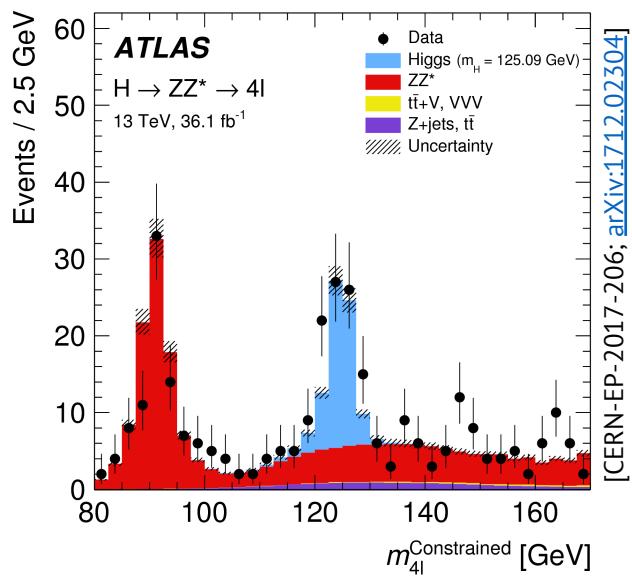

SFU

ATLAS at CERN

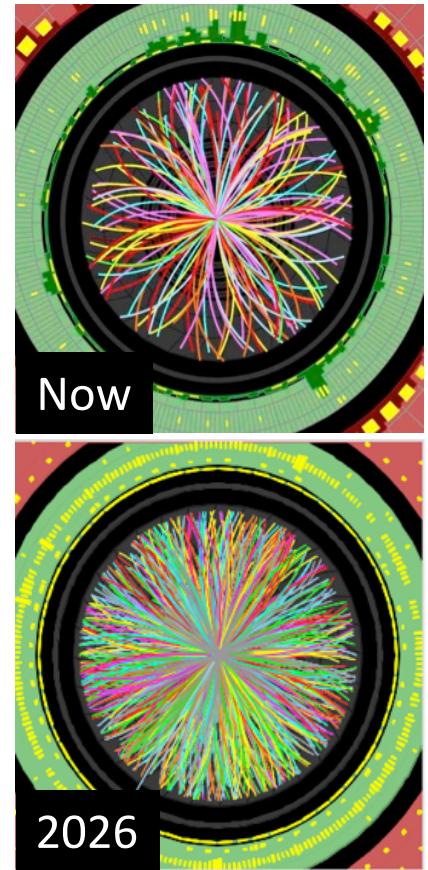

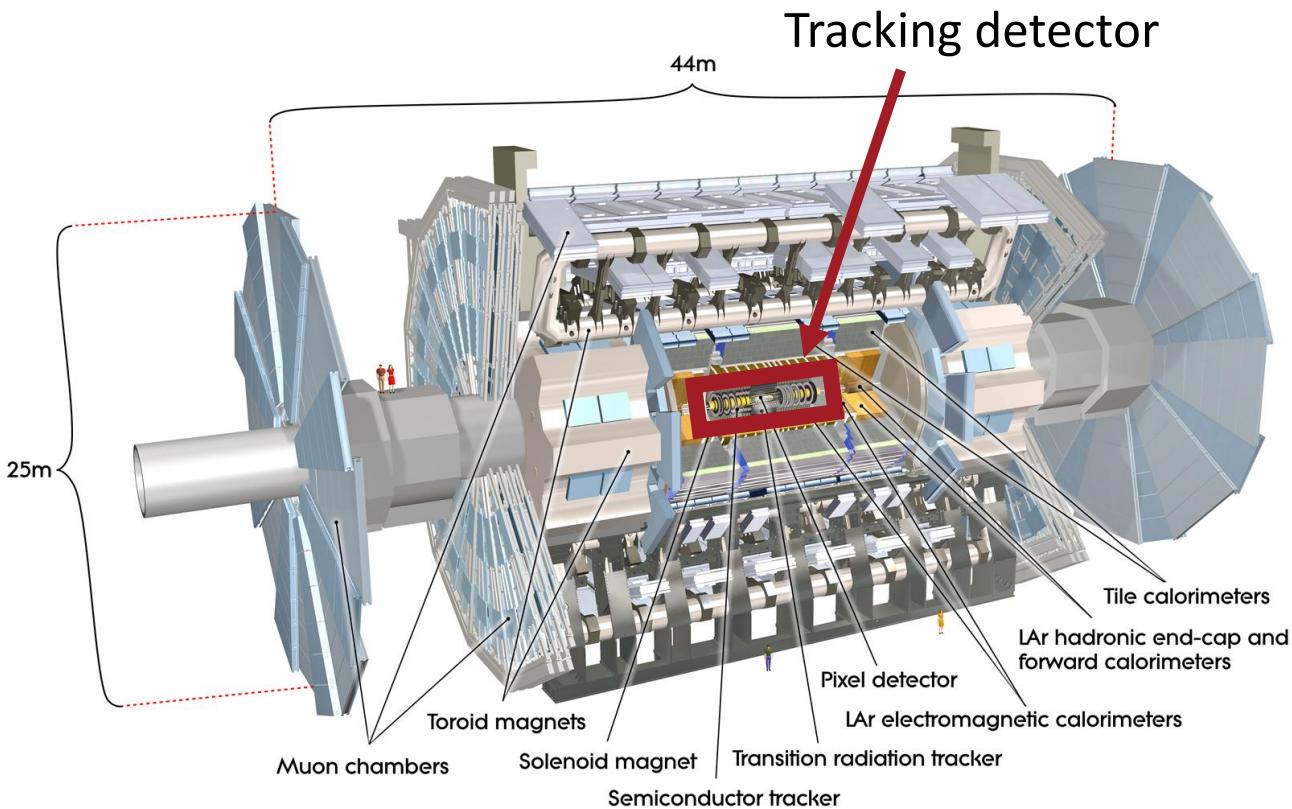

SFU

- Why is tracking important?
- Resolve and identify all tracks

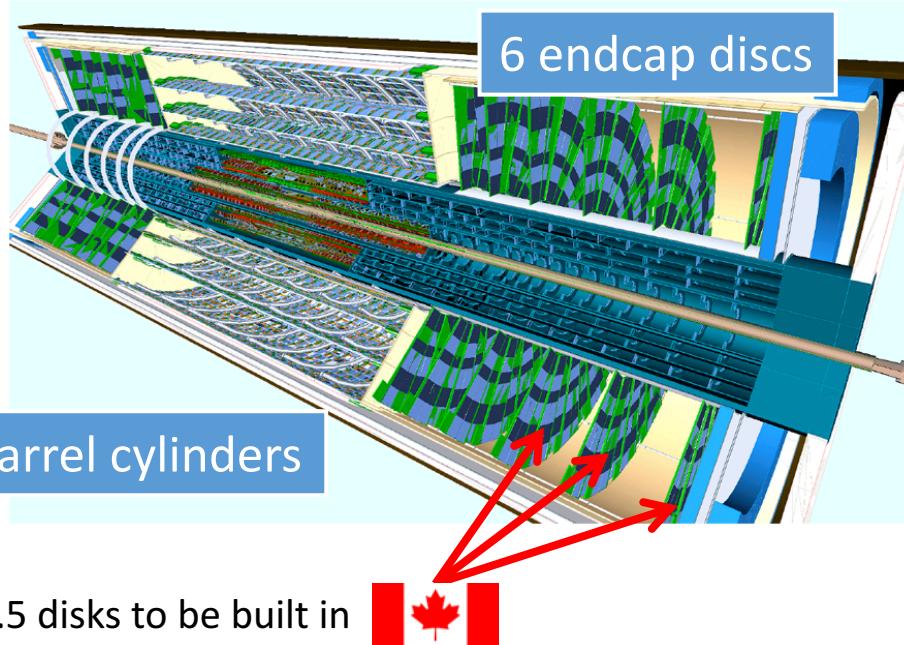

ATLAS at CERN

SFU

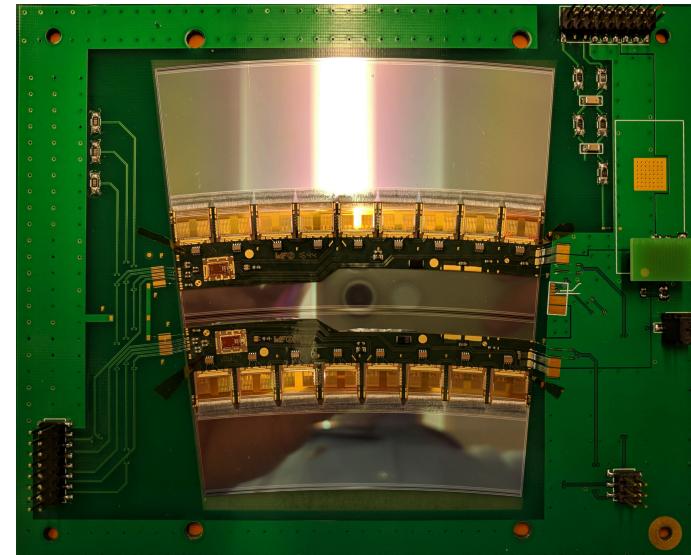

Inner Tracker (ITk) Strip Detector

SFU

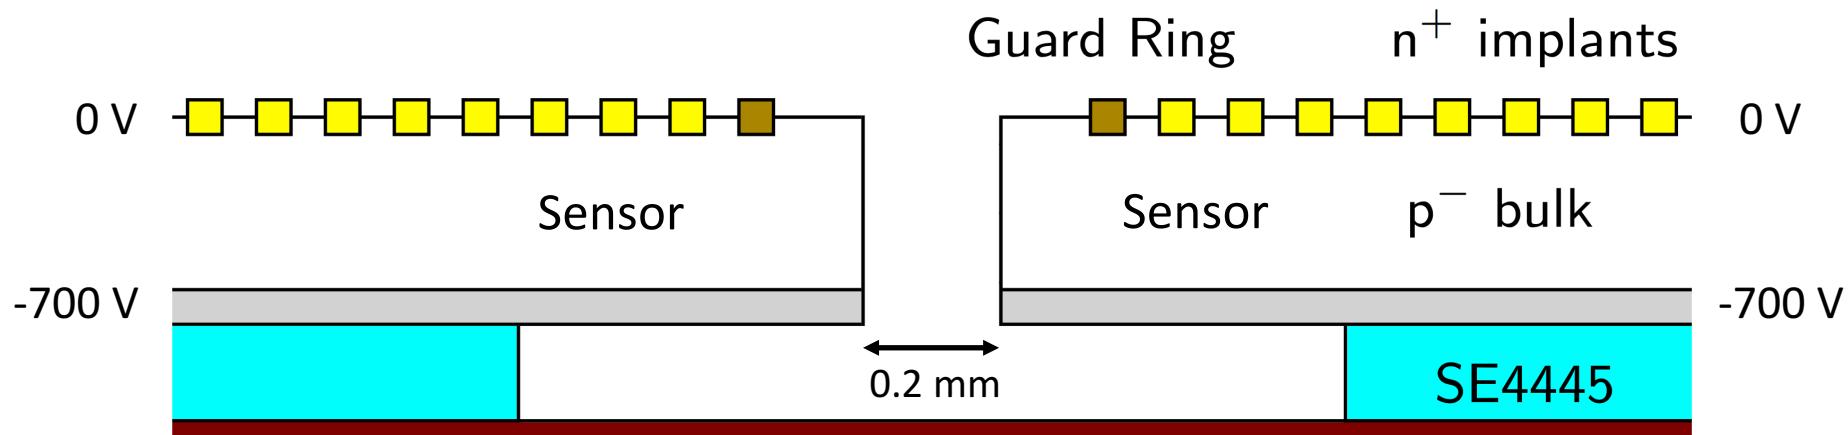

- Goal: Minimize dead area
- Place sensors close to each other
- Risk: Sparks between sensors

Inter-Sensor Isolation

SFU

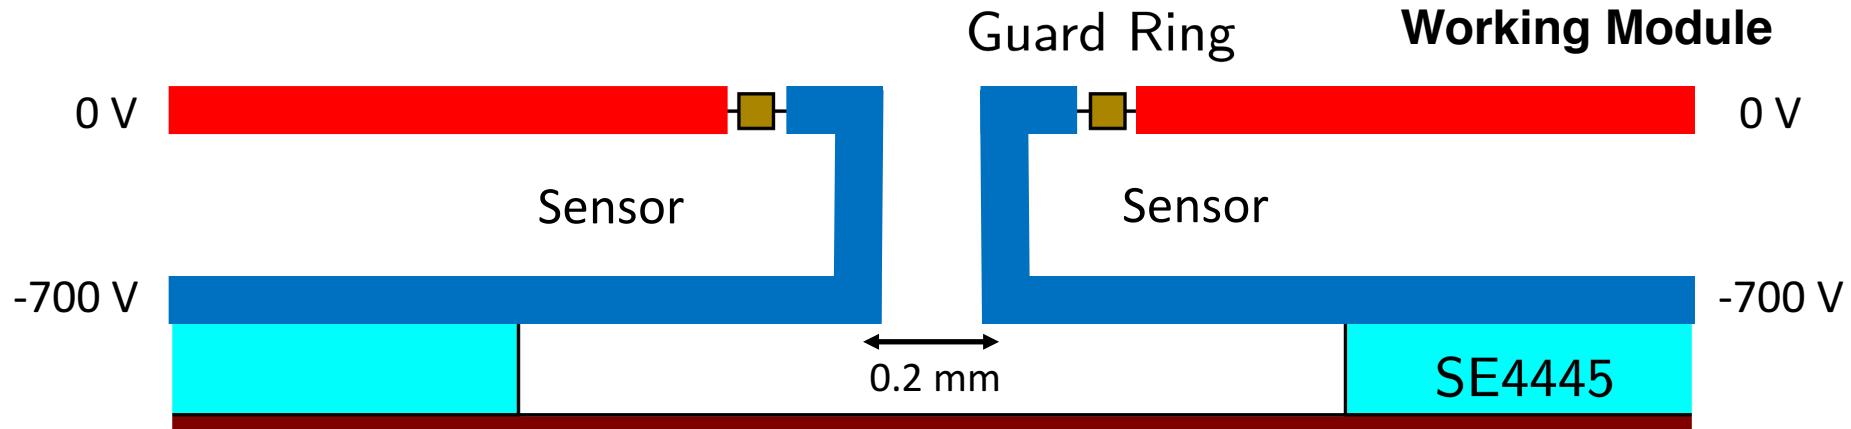

- Silicon sensors
- Reverse bias voltage: -700 V
- Switch off, if module fails
- HV between sensors

Inter-Sensor Isolation

SFU

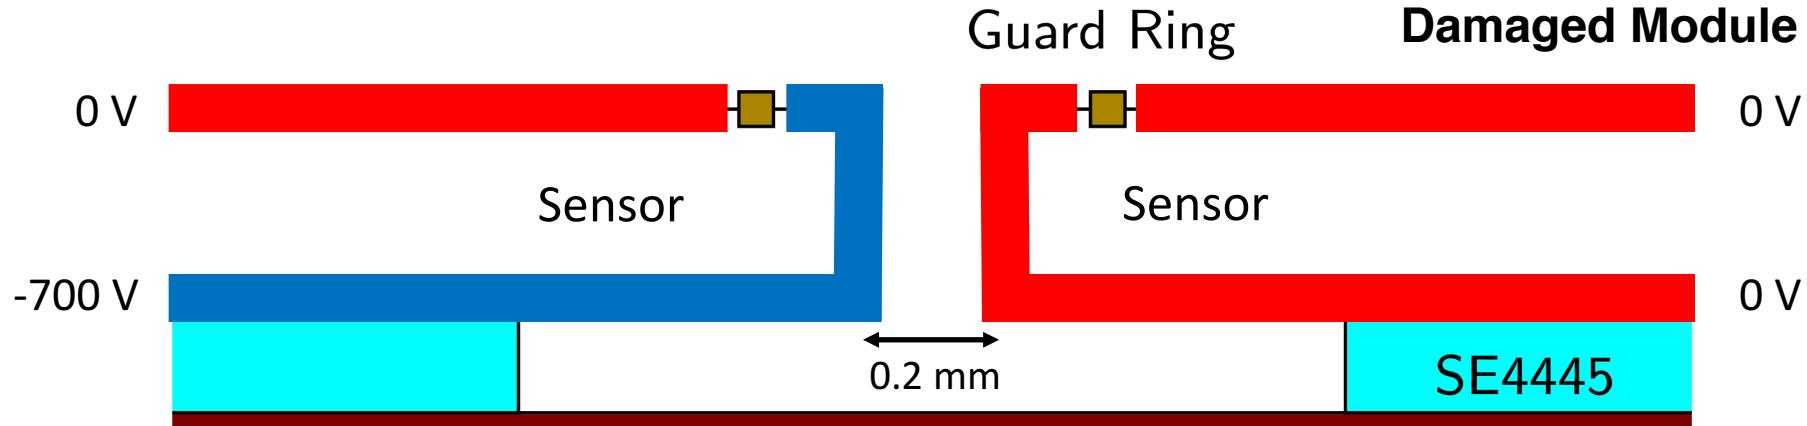

- Silicon sensors
- Reverse bias voltage: -700 V
- Switch off, if module fails
- HV between sensors

Inter-Sensor Isolation

SFU

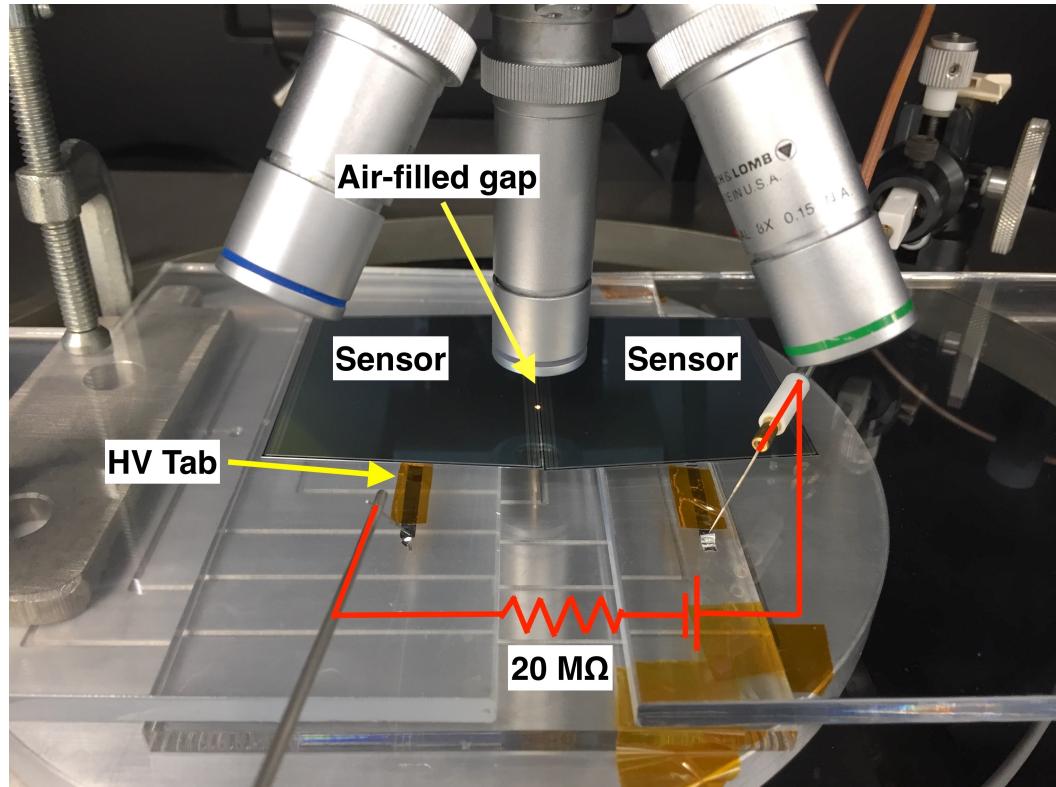

- Silicon sensors
 - Reverse bias voltage: -700 V
 - Switch off, if module fails
- HV between sensors
- Required for safe operation:
- Current $< 70 \text{ nA} \leq \text{Leakage current}$

Setup

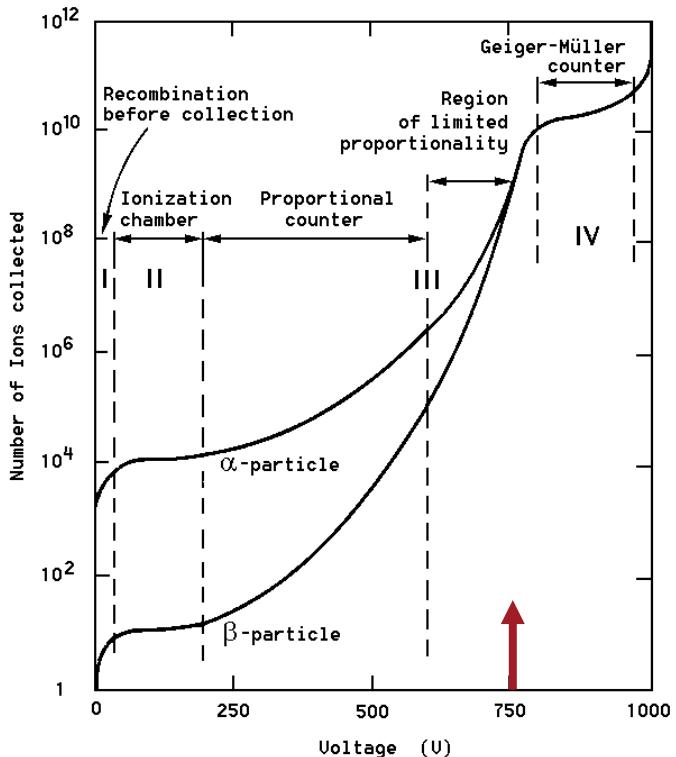

SFU

- Recreate situation in detector
- Use SCT sensors to approximate ITk sensors
- Control distance between sensors
- Contact backside
- Record current-voltage curves

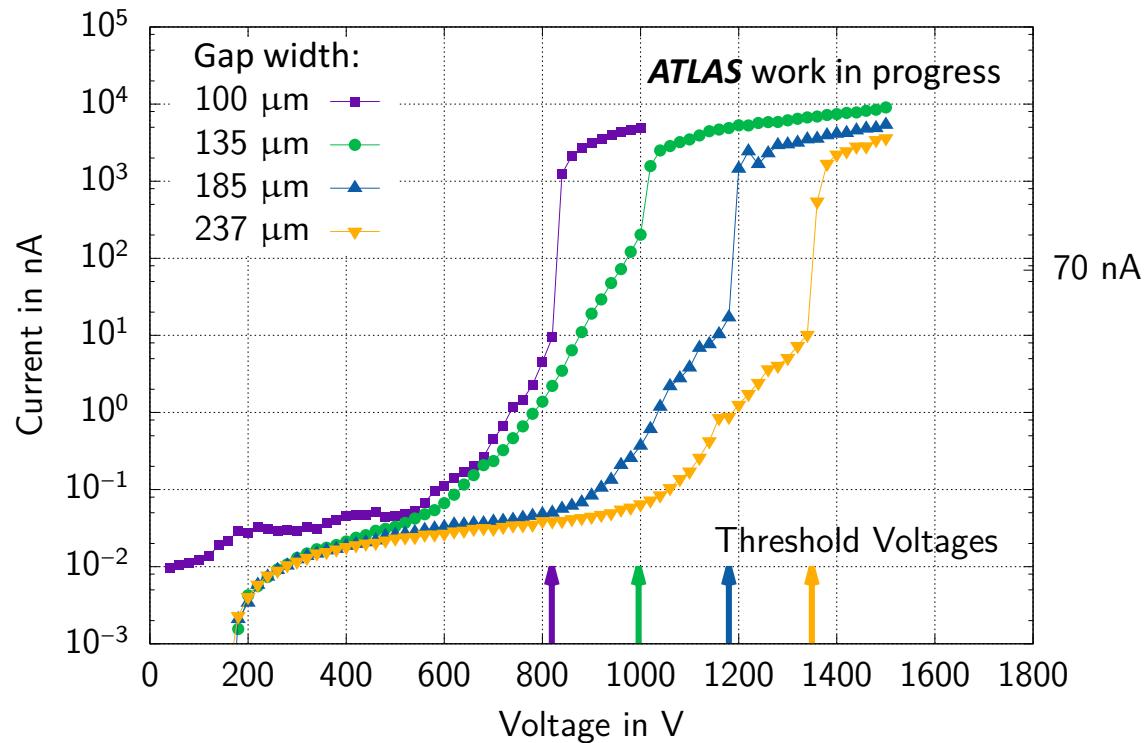

Current-Voltage Curves

SFU

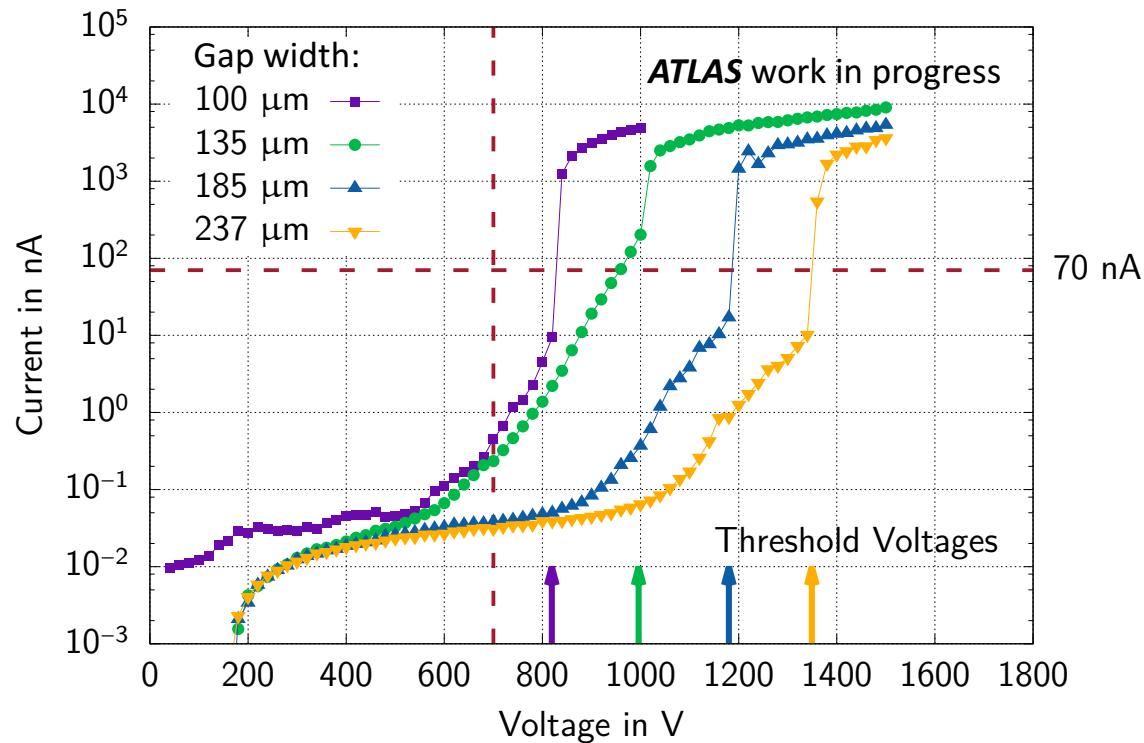

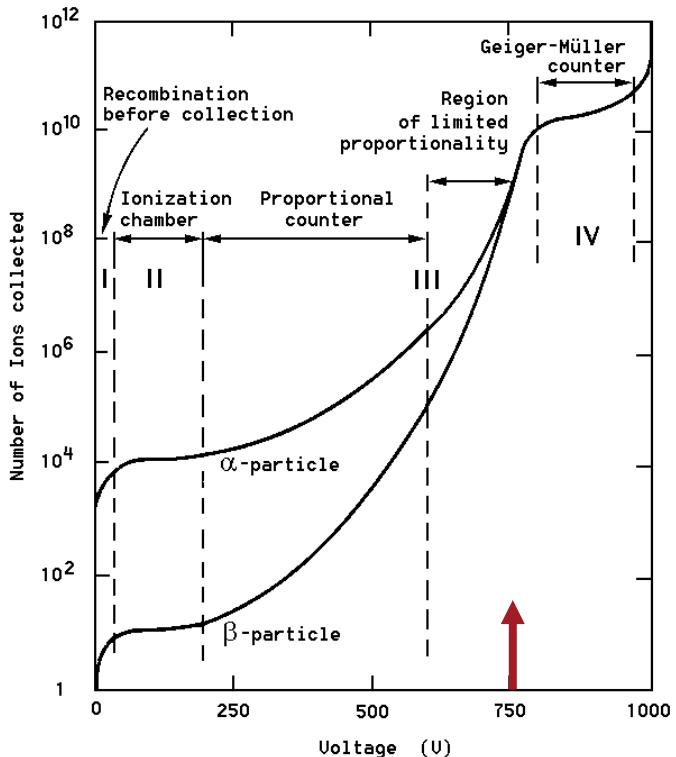

Schematically: $I(V)$ in gas detector

$I(V)$ between SCT sensors

Current-Voltage Curves

SFU

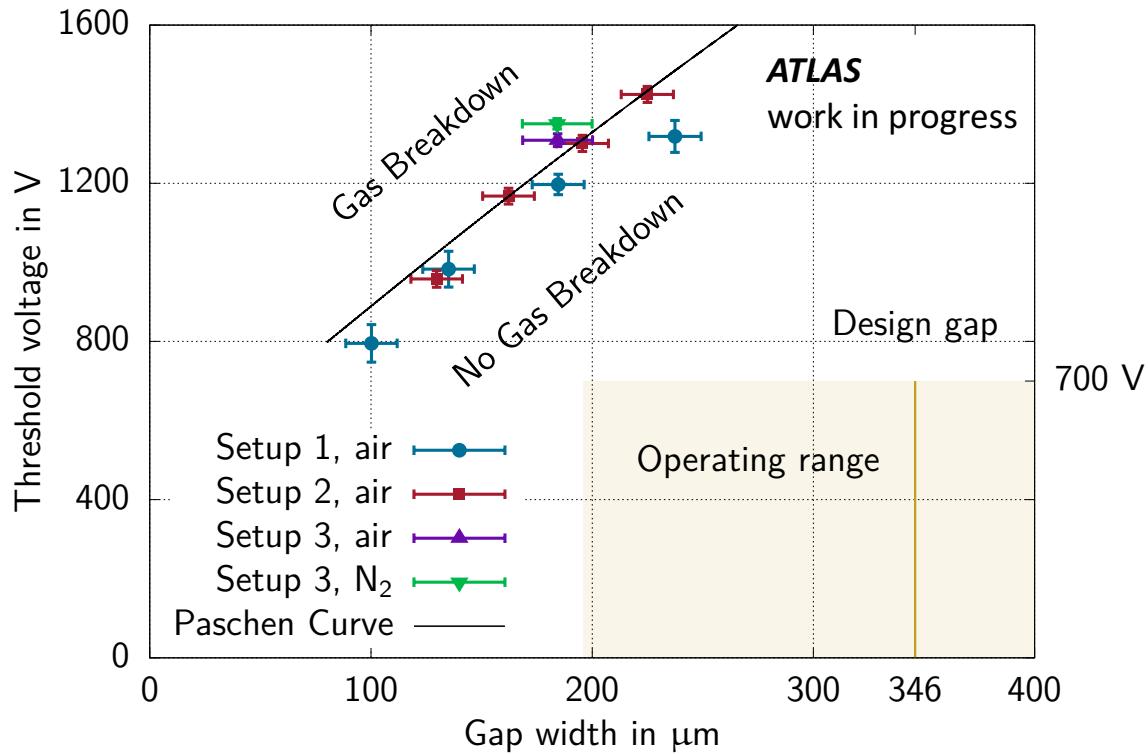

Schematically: $I(V)$ in gas detector

$I(V)$ between SCT sensors

Threshold Voltage

SFU

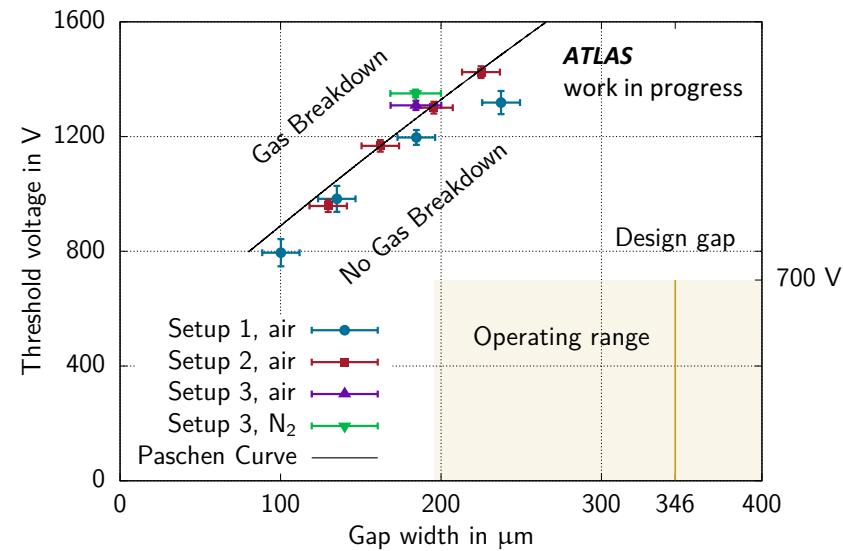

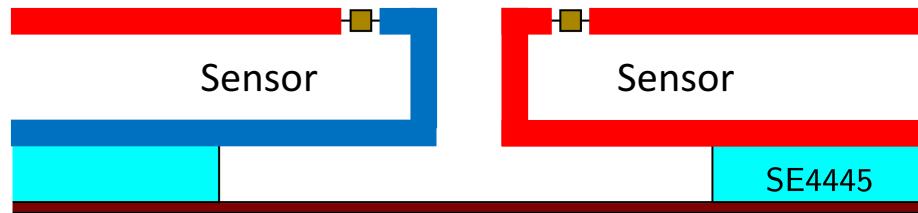

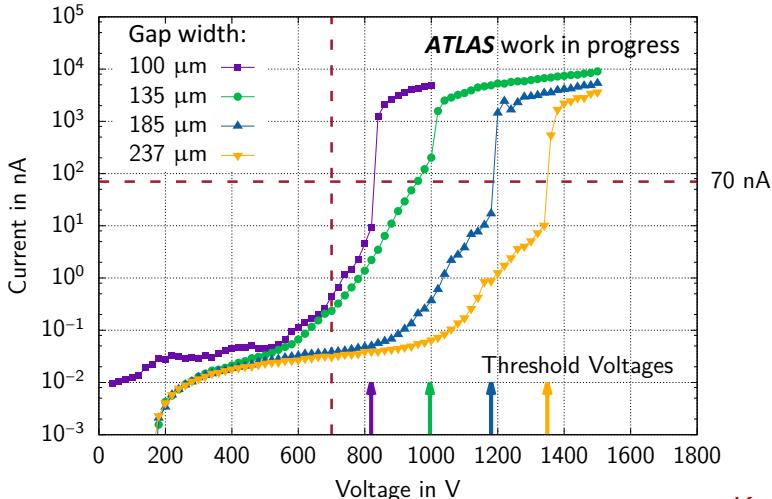

- Measurements agree well
- Measurements linear (expected)
- Operating range far from gas breakdown

Summary

SFU

- Do ITk modules need to be insulated?
 - Current < Leakage current
 - Voltage < Threshold voltage
- No insulation necessary

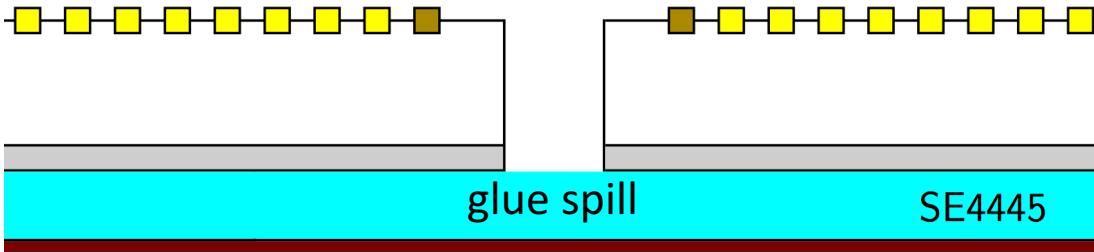

Backup

SFU

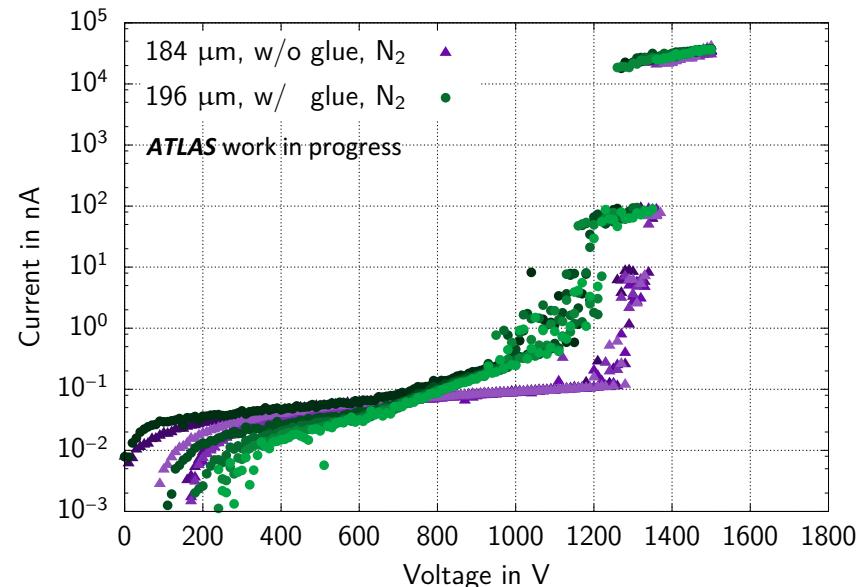

Risk of Glue Spills

SFU

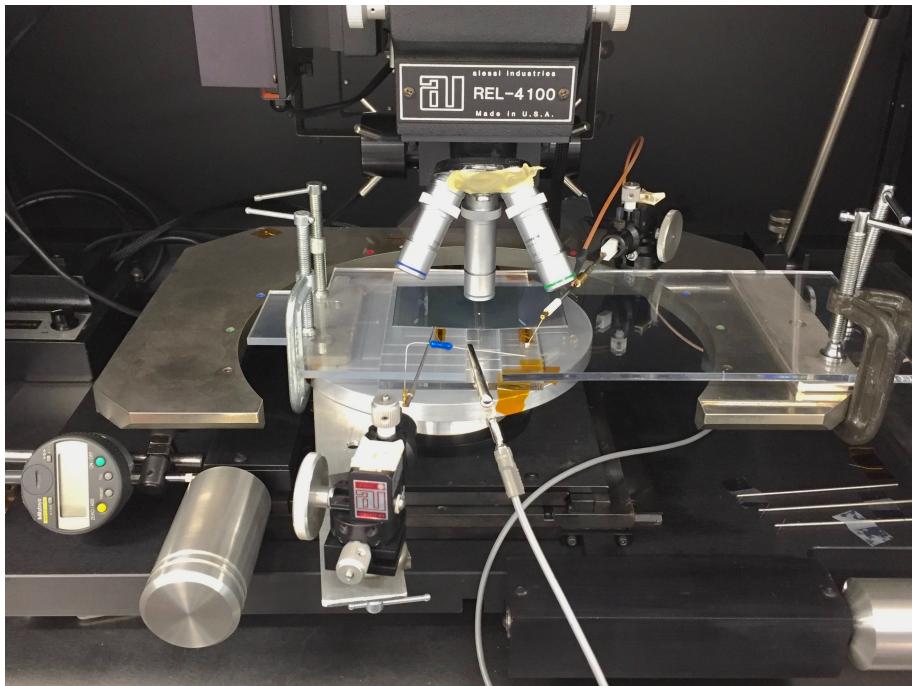

- Glue can run into gap
- Facilitates charge flow?

- Glue spill vs. clean gap
- Higher currents with glue
- Pronounced plateau
- Avoid glue in the gap

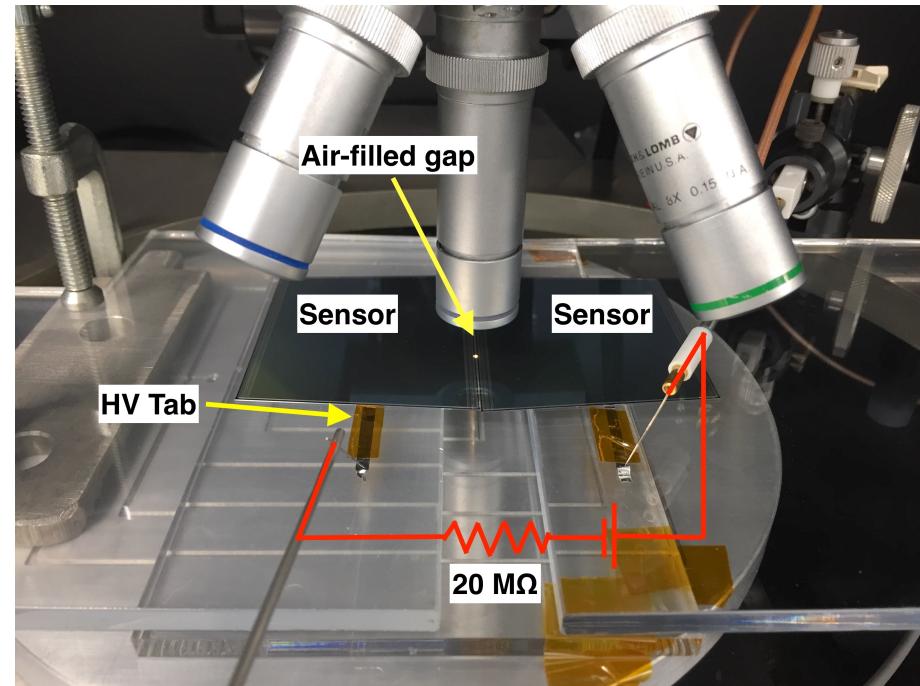

Measurement Setup

SFU

- Gas gap between SCT W32 sensors (Thanks to Freiburg!)
- Distance measurement with micrometer and microscope

- Voltage between backplanes using HV tabs
- Source meter: Keithley 2657a

Scaling of Threshold Voltage

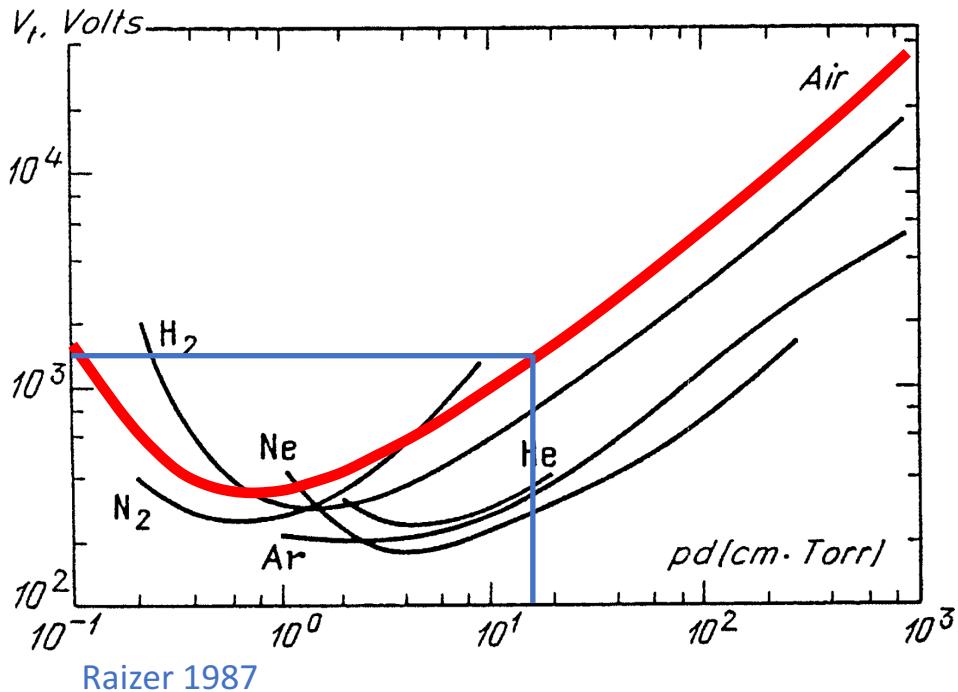

SFU

- Paschen's Law:

$$V_t = V_t(pd) = \frac{B(pd)}{C + \log(pd)}$$

with p = pressure, d = distance

- Large distance: $E = \frac{V}{d}$ small
- Small distance: No gas molecules to ionize

$$1 \text{ cm Torr} \approx 13 \mu\text{m atm}$$

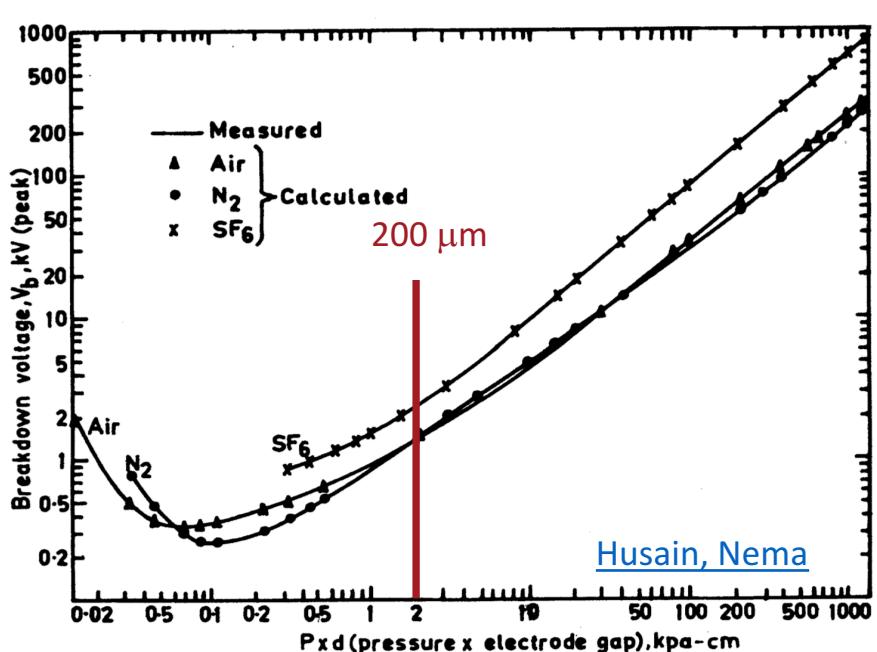

What else affects Gas Discharge?

SFU

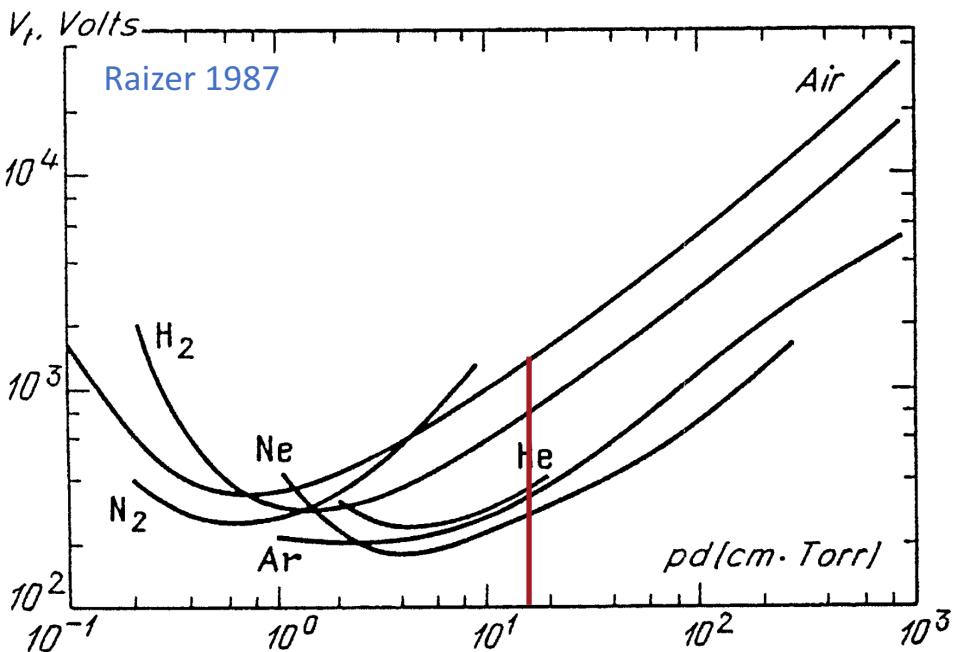

- ATLAS-altitude pressure
 - taken in to account using Paschen's Law
- 2T magnetic field
 - only important for end-caps, should only decrease current
- Edge surface: ITk stealth-diced, SCT blade-diced
 - conservative estimate
- Additional ATLAS radiation → increases gas discharge current
 - only small effect
- Does radiation change silicon edge?
- Gas discharge in nitrogen vs. air

Gas Discharge in Nitrogen vs. Air

- Paschen curves for different gases

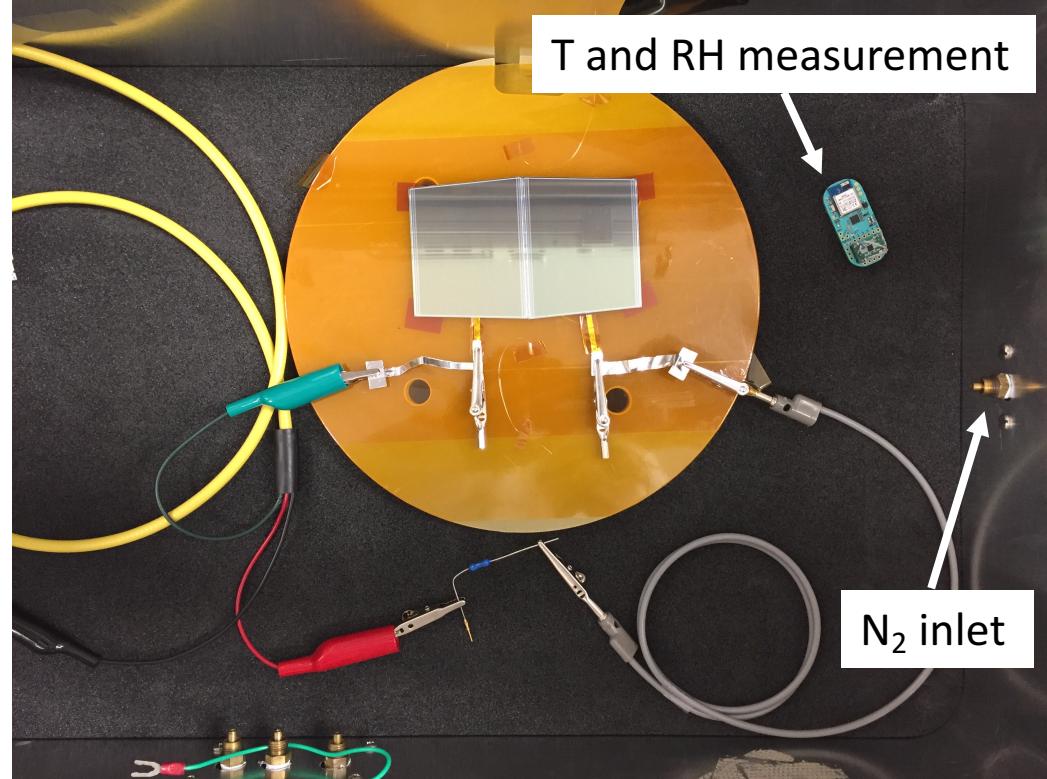

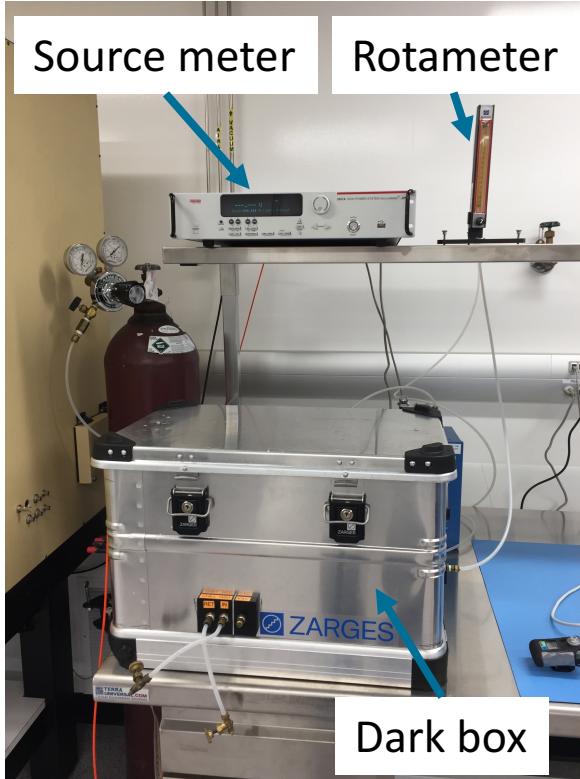

Husain, Nema

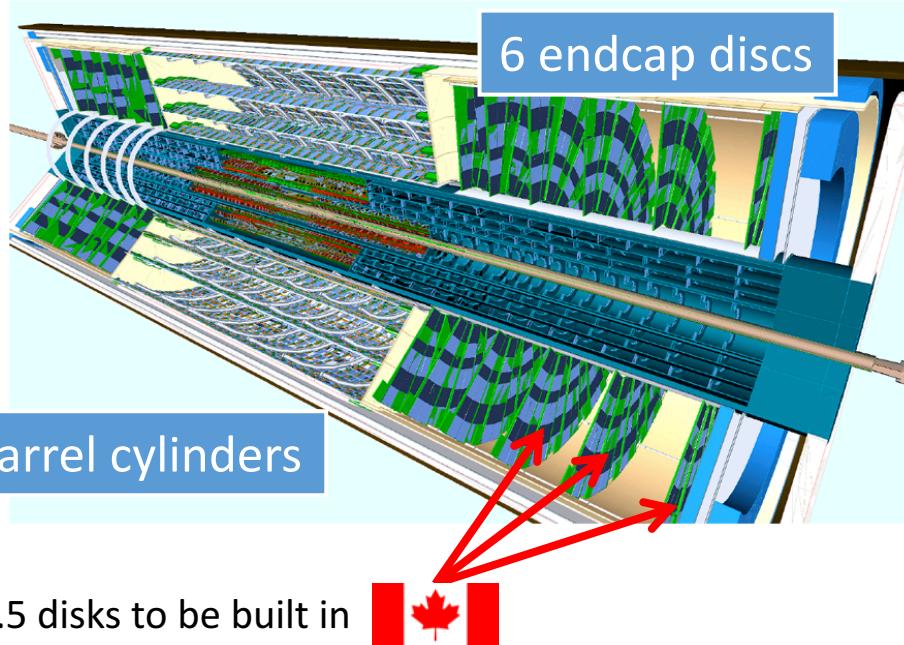

Setup 3

SFU

Inner Tracker (ITk) Strip Detector

SFU

- Goal: Minimize dead area
- Place sensors close to each other
- Risk: Sparks between sensors
