### ABSTRACT

NMR detected by radioactive beta decay,  $\beta$ -NMR, is undergoing a renaissance largely due to the availability of high intensity low energy beams of the most common probe ion,  $^8\text{Li}^+$ , and dedicated facilities for materials research. The radioactive detection scheme, combined with the low energy ion beam, enable depth resolved NMR measurements in crystals, thin films and multilayers on depth scales of 2–200 nm. After a brief historical introduction, technical aspects of implanted-ion  $\beta$ -NMR are presented, followed by a review of recent applications to a wide range of solids.

# A “nanoscience” example

$^8\text{Li}$   $\beta$ -NMR of a monolayer of  $\text{Mn}_{12}$  single molecule magnets

Z. Salman et al., Nano Lett. 7, 1551 (2007)

# The “killer” features of $\beta$ -NMR at TRIUMF

- $\sim 10^{10}$  times more sensitive than “conventional” NMR.
- depth resolution on the scale of  $\sim 1$  nm to  $\sim 500$  nm.
- can be used to study (almost) any material.

## Raison d'être:

A technique for studying materials / systems that are difficult / inaccessible by conventional means!

# What about “chemical” applications of $\beta$ -NMR?

**chem·is·try**

noun

1. the branch of science that deals with the identification of the substances of which matter is composed;  
the investigation of their properties and the ways in which they interact, combine, and change;  
and the use of these processes to form new substances.
2. the complex emotional or psychological interaction between two people.

Sauer, <sup>a</sup> Paul Schaffer, <sup>j</sup> Peter W. Thulstrup, <sup>a</sup> Lars Hemmingsen\*<sup>a</sup> and Monika Stachura <sup>\*j</sup>

NMR spectra of  $Mg^{2+}$  ions in ionic liquids were recorded using a highly sensitive variant of NMR spectroscopy known as  $\beta$ -NMR. The  $\beta$ -NMR spectra of  $MgCl_2$  in EMIM-Ac and EMIM-DCA compare favourably with conventional NMR, and exhibit linewidths of

high-intensity radioactive ion beam (RIB) facilities, many new nuclei are available in quantities sufficient for the study of condensed matter. The main challenge to the use of RIBs as probes in liquids is the incompatibility of typical solutions

# Concluding remarks

- TRIUMF's  $\beta$ -NMR facility is a unique scientific tool with a diverse portfolio of applications.
- TRIUMF is pioneering new applications of  $\beta$ -NMR, with long-term goals of studying biochemistry / medicine.
- The potential for novel discovery is high!

## Acknowledgements:

## $\beta$ -NMR

Gerald D. Morris

Published online: 23 October 2013  
© Springer Science+Business Media Dordrecht 2013

**Abstract** The  $\beta$ -NMR facility at ISAC is constructed specifically for experiments in condensed matter physics with radioactive ion beams. Using co-linear optical pumping, a  ${}^8\text{Li}^+$  ion beam having a large nuclear spin polarisation and low energy (nominally 30 keV) can be generated. When implanted into materials these ions penetrate to shallow depths comparable to length scales of interest in the physics of surfaces and interfaces between materials. Such low-energy ions can be decelerated with simple electrostatic optics to enable depth-resolved studies of near-surface phenomena over the range of about 2–200 nm. Since the  $\beta$ -NMR signal is extracted

Published online: 22 November 2016  
© Springer International Publishing Switzerland 2016

**Abstract** A 28 keV beam of  $^{31}\text{Mg}^+$  ions was extracted from a uranium carbide, proton-beam-irradiated target coupled to a laser ion source. The ion beam was nuclear-spin polarized by collinear optical pumping on the  $^2\text{S}_{1/2}$ – $^2\text{P}_{1/2}$  transition at 280 nm. The polarization was preserved by an extended 1 mT guide field as the beam was transported via electrostatic bends into a 2.5 T longitudinal magnetic field. There the beam was implanted into a single crystal MgO target and the beta decay asymmetry was measured. Both hyperfine ground states were optically pumped with a single frequency light source, using segmentation of the beam energy, which boosted the polarization by approximately 50 %

$\beta$ -NMR / Publications

## Publications

This is my (unofficial) curated list of  $\beta$ -NMR (and related) publications coming out of TRIUMF. Most of the literature is related to materials science, but results from nuclear physics experiments are also included for completeness.

The current number of publications, broken down by category, is:

Electronic Preprints:	2
Journal Articles:	45
Reviews:	5
Conference:	58
Proceedings:	
Theses:	10

For a glimpse at ongoing research using the technique, have a look at the  [\$\beta\$ -NMR / Experiments](#) page.
