

# SiPM Stability Tests

Lucas Darroch for the nEXO collaboration  
Virtual Presentation  
WNPPC 2022  
February 18

**McGill**

- Neutrino Osc.  $\Rightarrow m_\nu \neq 0$
- Dirac mass  $\Rightarrow \nu_R$

Dirac mass term for neutrino:

$$L_D = -m_D(\bar{\nu}_R\nu_L + \bar{\nu}_L\nu_R)$$

Why is the Dirac mass so small?

Majorana mass term for neutrino:

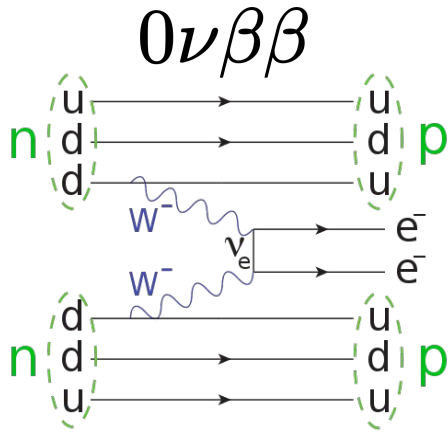

$$L_M = -\frac{1}{2}M(\bar{\nu}_R^C\nu_R + \bar{\nu}_R\nu_R^C)$$

$$\Psi^C = \hat{C}\hat{P}\Psi = i\gamma^2\gamma^0\Psi^*$$

## Standard Model of Elementary Particles

- $0\nu\beta\beta \Rightarrow \nu$  : Majorana particle
- $2\nu\beta\beta$  SM process

## $\beta\beta$ - Decay Spectrum

Image from Vogel, Petr. "Neutrinoless double beta decay." *AIP Conference Proceedings*. Vol. 870. No. 1. AIP, 2006.

- $2\nu\beta\beta$  spectrum continuous;
- $0\nu\beta\beta$  spectrum sharply peaked

- Single phase TPC
- 5 tonnes LXe, 90%  $^{136}\text{Xe}$
- Ionization and scintillation signals recorded
- Sensitivity  $\sim 10^{28}$  years for  $0\nu\beta\beta$  half-life<sup>1</sup>

# Liquid Xenon Photon Detector with Highly Granular Scintillation Readout for MEG II Experiment

**W. Ootani** ICEPP, The University of Tokyo  
on behalf of MEG II collaboration  
Calorimetry for the High Energy Frontier (CHEF2019)  
Nov. 25th-29th, 2019, Fukuoka, Japan

Hamamatsu S10943-4372

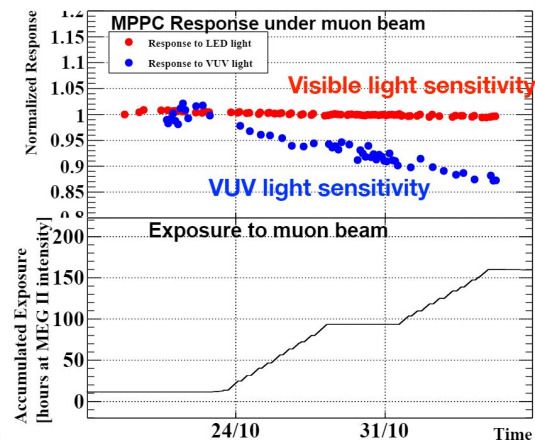

## A Surprise...

- Significant degradation of MPPC VUV-sensitivity!
  - Seems correlated with beam ON/OFF
  - Large degradation for VUV-sensitivity ( $\leftrightarrow$  slight degradation for visible light)
  - Degradation is quite fast: ( $\sim 0.08\%/hour$ )
  - We can't survive even for one year...
- Can be a showstopper...

Radiation	Dose (run2019)
Gamma	$\sim 10^{-2}$ Gy/sensor
Neutron	$2.7 \times 10^6$ n <sub>1MeV</sub> /cm <sup>2</sup>
VUV-light	$\sim 10^{14}$ photons/sensor

↓  
Dose level is quite low

RTD-lugs

- HPK 4x4 mini tile (VUV4)
- RTD-lugs coupled to PCB

PCB designed at  
Brookhaven National Lab

Environmental Test Stand (cryostat):

- Large surface area:  $A \sim 150 \text{ cm}^2$
- Stable operation:  $\sigma_T \sim 1 \text{ mK (3h)}$
- Demonstrated range: 120 - 295 K
- Turnaround time:  $T \sim 1 \text{ day}$

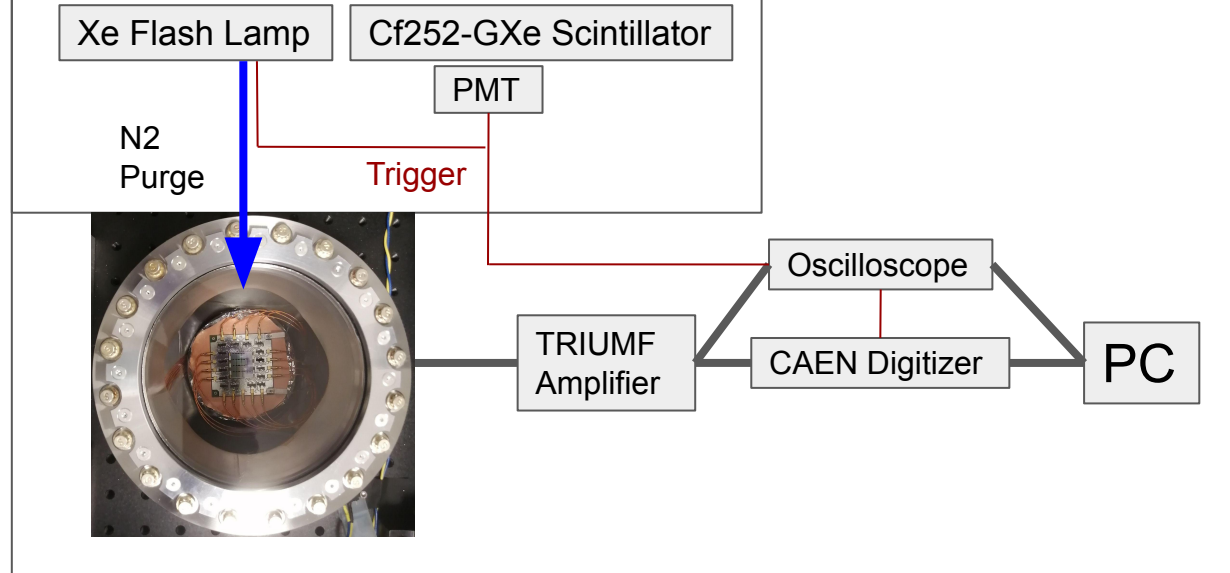

# Characterization Measurements:

- Record scintillation spectrum from GXe excited by Cf252

SiPM Stability Tests - Darroch

## Dark Box

### Procedure:

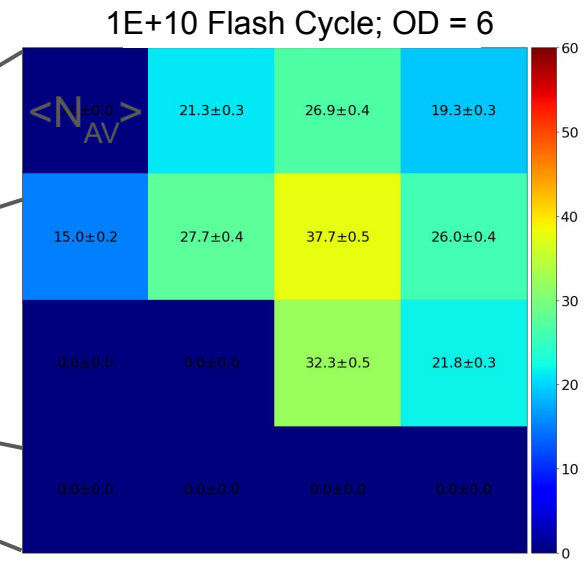

1. Characterization Measurements
2. Flashlamp lightmap
3. Flash  $10^{14}$  photons (no bias on SiPM 12)
4. Return to step 1
5. When  $\gg 10^{14}$  /mm<sup>2</sup> photons flashed, anneal SiPM, return to step 1

# Flash Lamp Lightmap

$$\langle N_{PH} \rangle = \langle N_{AV} \rangle \times 10^{(6-OD)} \div PDE$$

SiPM Stability Tests - Darroch

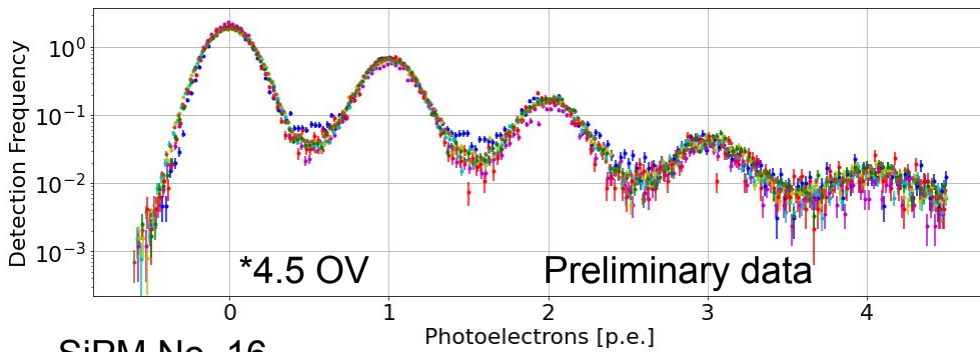

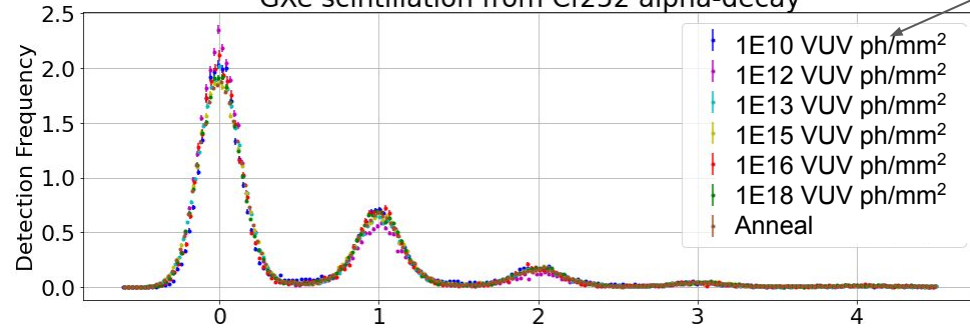

# Cf252 Truncated Spectrum

$$\langle N_{PH} \rangle = \langle N_{AV} \rangle \times 10^{(6-OD)} \div PDE$$

GXe scintillation from Cf252 alpha-decay

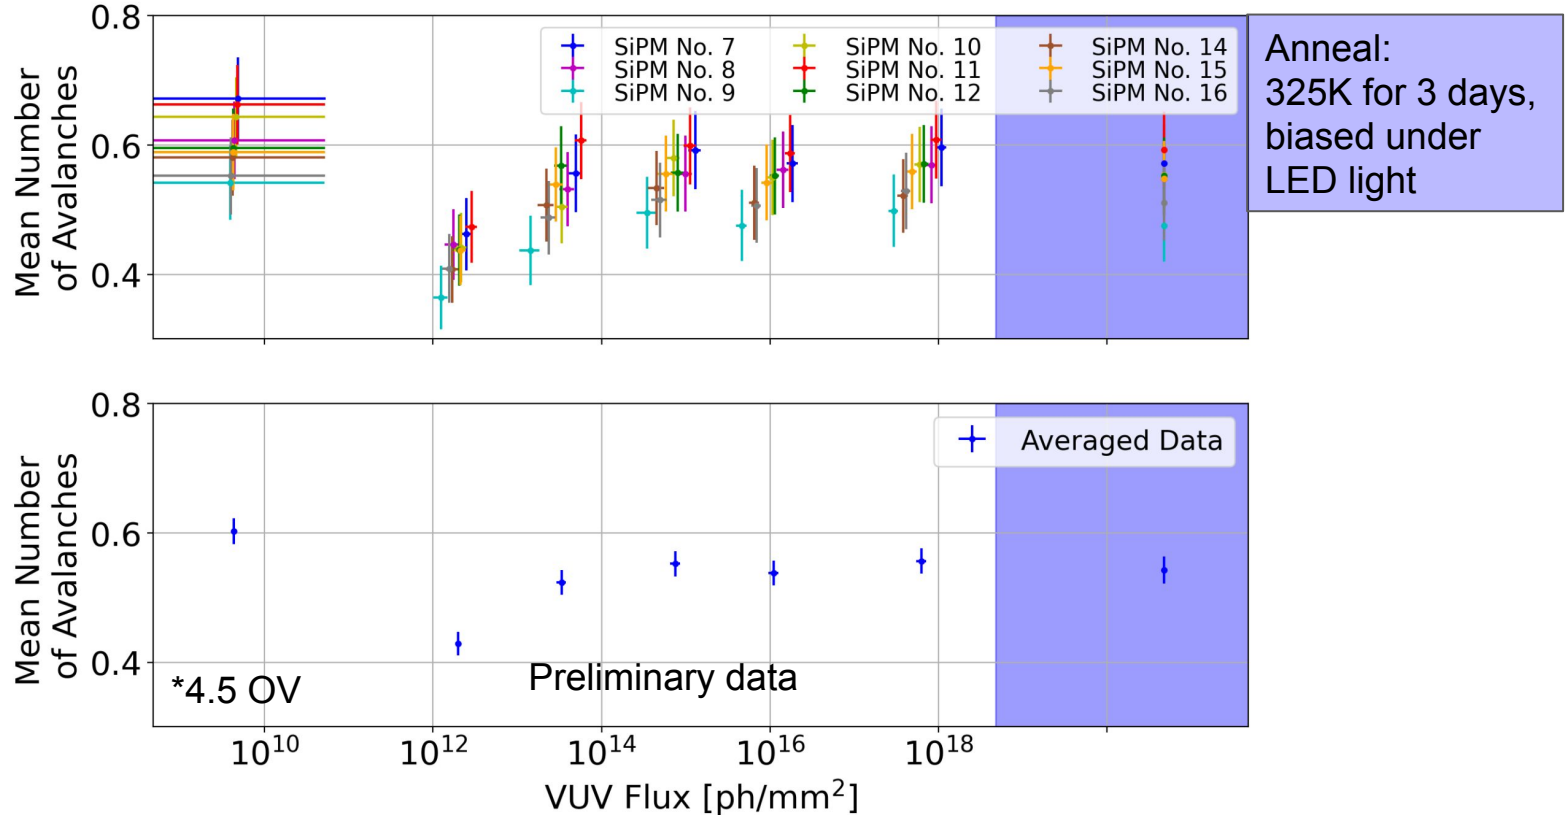

SiPM No. 16

PMT used for coincidence trigger

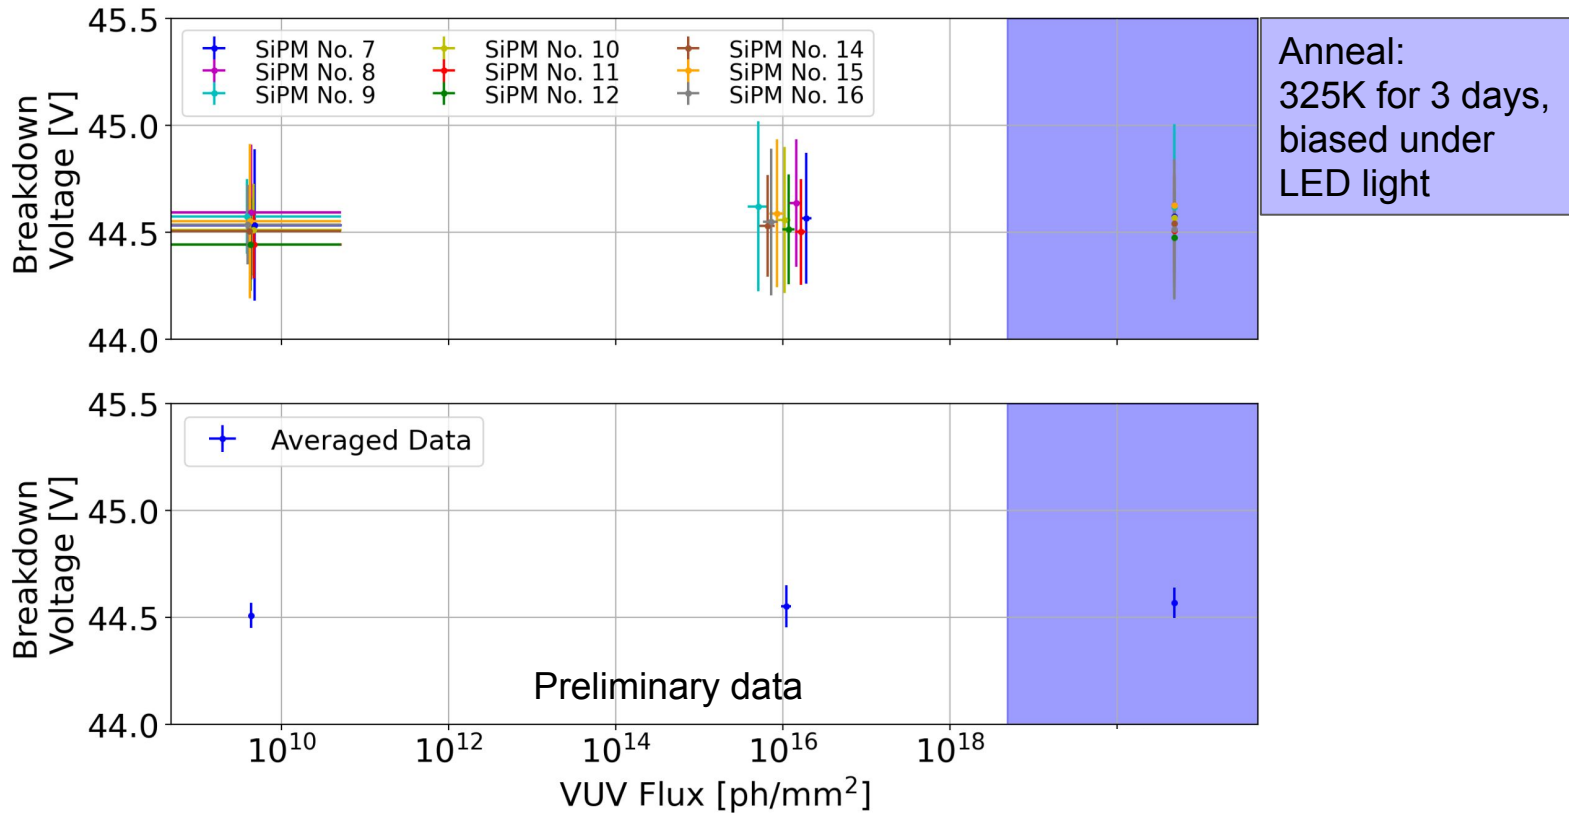

# Sensitivity to VUV Light

# SiPM Gain

# Breakdown Voltage

# Conclusion

- HPK VUV4 have been tested under high density UV light
- No change observed for: PDE, Gain, Breakdown Voltage

# The nEXO Collaboration

# Type 1 See-saw Mechanism

Seesaw mechanism helps make sense of light neutrinos:

$$m_{\pm} \approx \frac{1}{2}M \pm \frac{1}{2} \left( M + \frac{2m_D^2}{M} \right)$$

$$m_- \approx \frac{m_D^2}{M} \quad m_+ \approx M$$

- Dirac mass for neutrino  $\sim$  GeV
- Majorana mass large  $\sim 10^{11}$  GeV
- Light neutrino state  $\sim 10$  meV

Light neutrino state dominated by left(right)-handed chiral (anti)neutrino states; heavy neutrino state dominated by right(left)-handed chiral (anti)neutrino states.

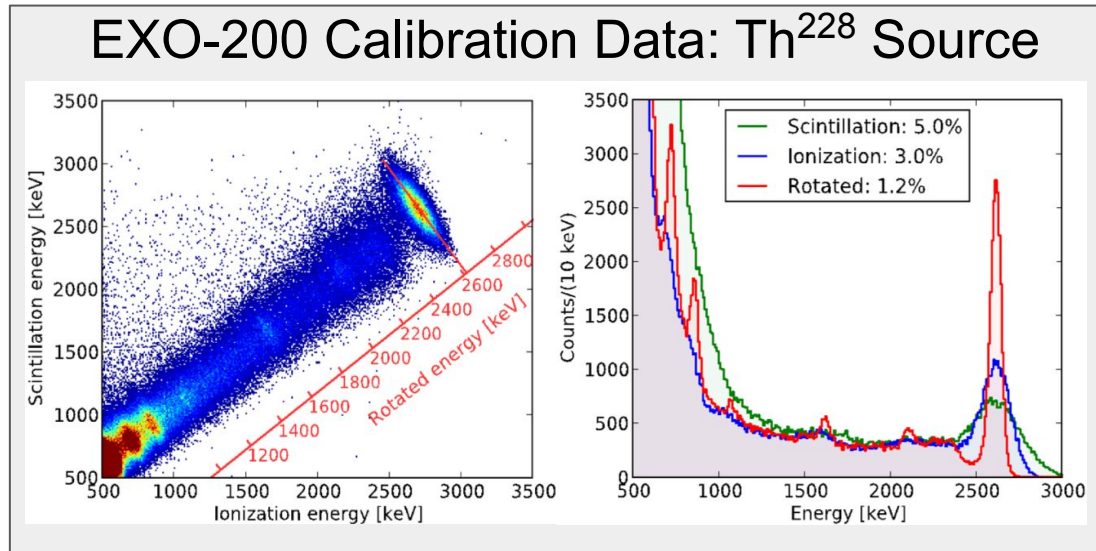

$$\nu_- \approx (\nu_L + \nu_L^c) - \frac{m_D}{M} (\nu_R + \nu_R^c)$$

$$\nu_+ \approx (\nu_R + \nu_R^c) - \frac{m_D}{M} (\nu_L + \nu_L^c)$$

Mohapatra, R. N., et al. "Theory of neutrinos: a white paper." *Reports on Progress in Physics* 70.11 (2007): 1757.

# Event reconstruction in LXe:

- Detection of scintillation and ionization signals
- Full energy reconstruction
- Full position reconstruction
- Event multiplicity

Images from Albert, J. B., et al. "Improved measurement of the  $2\nu\beta\beta$  half-life of  $^{136}\text{Xe}$  with the EXO-200 detector." *Physical Review C* 89.1 (2014): 015502.

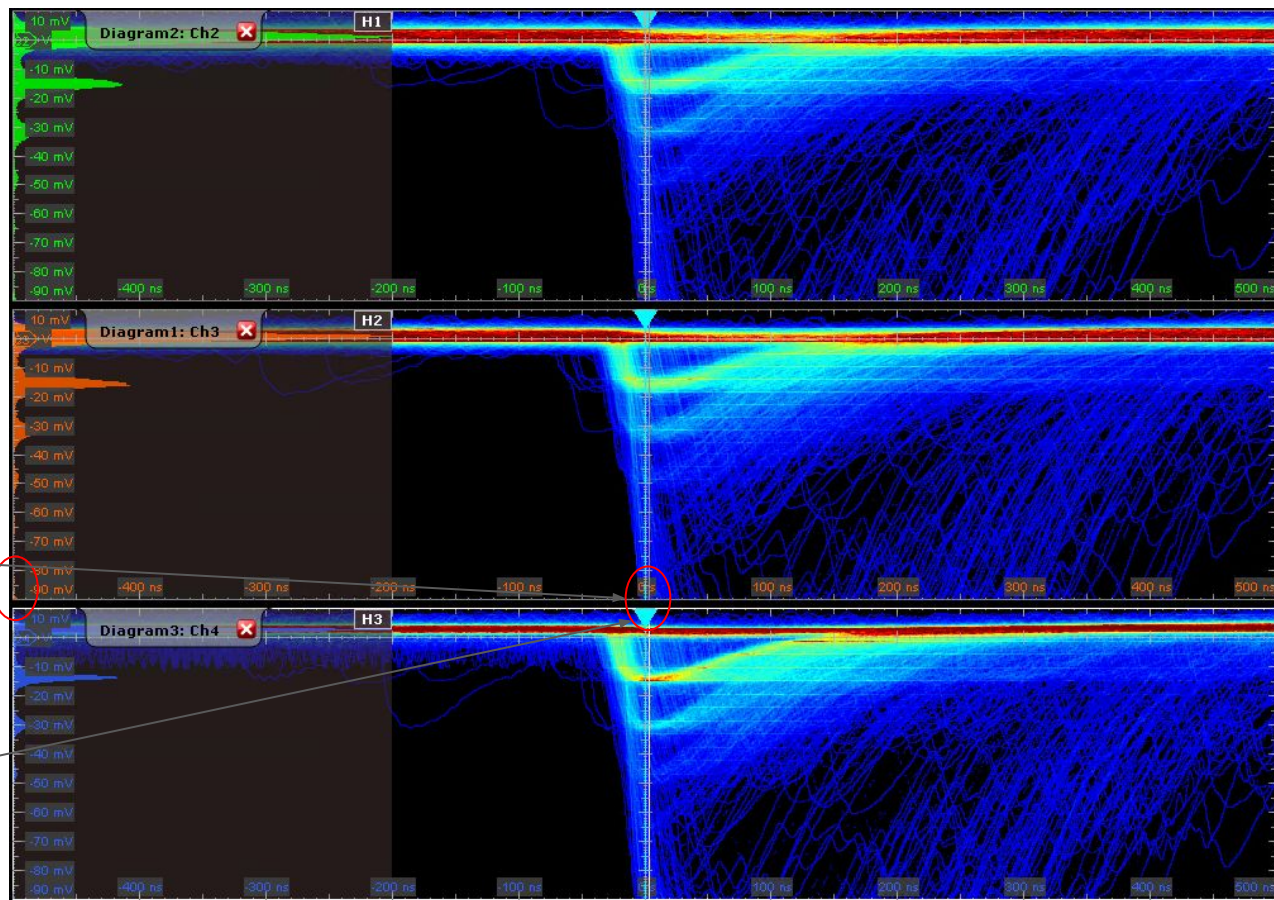

# Amplitude Sampling

- SPE max when sampling  $\sim 2$  ns post trigger
- Pulses sampled  $\sim 2$  ns post trigger for all measurements
- Similar method for flash lamp
- Events with  $pe > 4.5$  crosses sampling window before peak

Alpha  $> 4.5$  pe  
Rare

Fission  $> 4.5$  pe  
 $\sim \frac{1}{8}$  of events

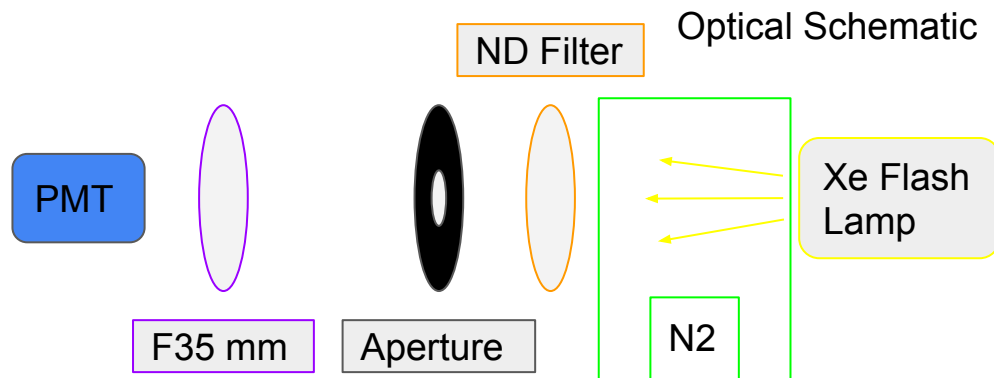

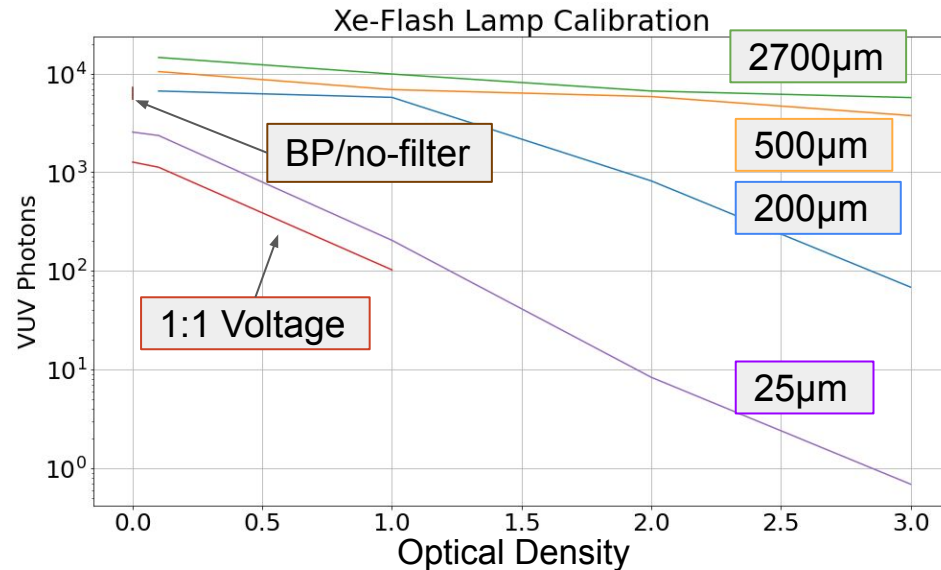

# Filter Calibration

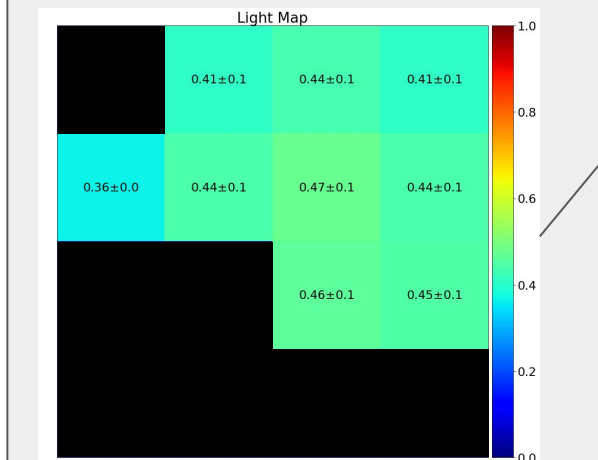

Testing setup for lens/filter characterization

Lens, filter, and aperture mounted inside of the Lamp Holder

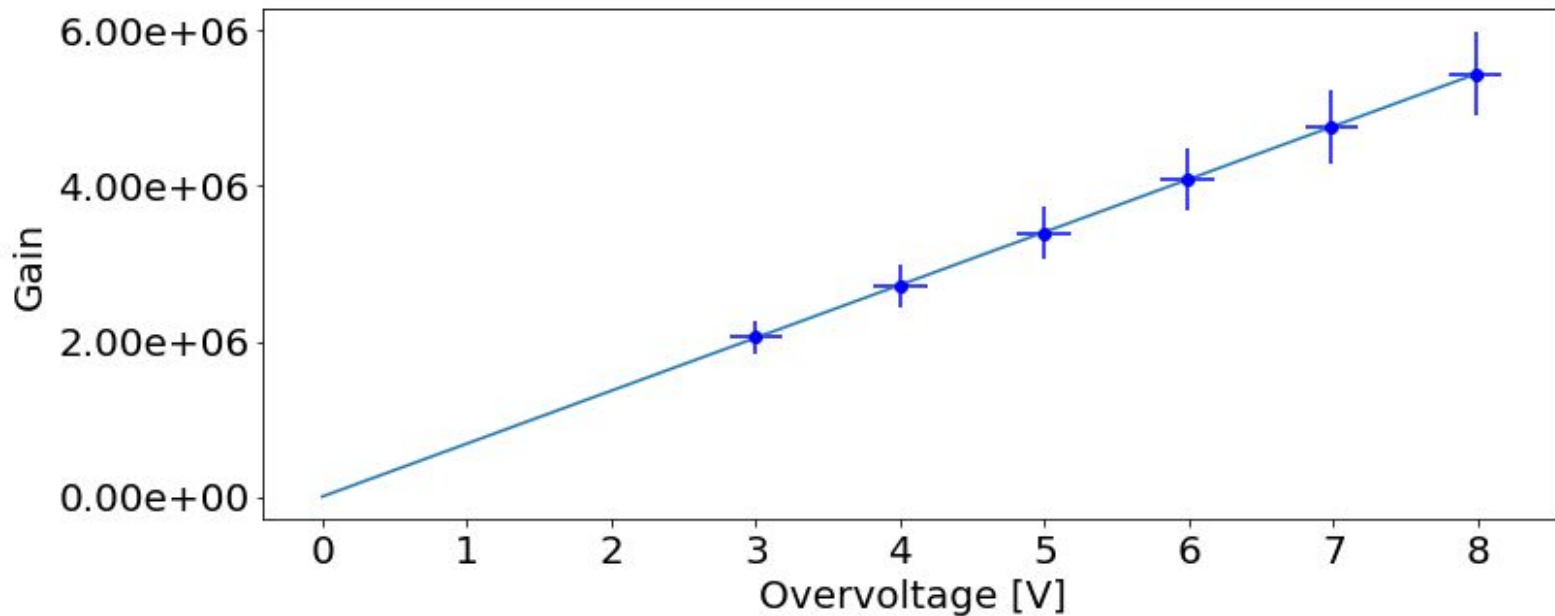

SiPM  $\langle N_{AV} \rangle$  from Cf252-GXe source

$\langle N_{AV} \rangle$  from flash calibration; OD decreases over experiment

## Charge-Gain

Flash Cycle: 1.0e+12 VUV ph

SiPM No. 16.0

Breakdown Voltage: 44.5 +/- 0.2 V

Charge-Gain: 681832 +/- 26958 1/V

Capacitance: 1.09e-13 +/- 3.05e-16 F
