

Cosmic Formation of the (Heavy) Elements And Rare Isotope Experiments at FRIB

Hendrik Schatz

Facility for Rare Isotope Beams and Dept. of Physics and Astronomy
Michigan State University

Cosmic Formation of the Elements: Open Question at the Beginning of the Century

Periodic Table of the Elements

Elements from “Iron” to Uranium:

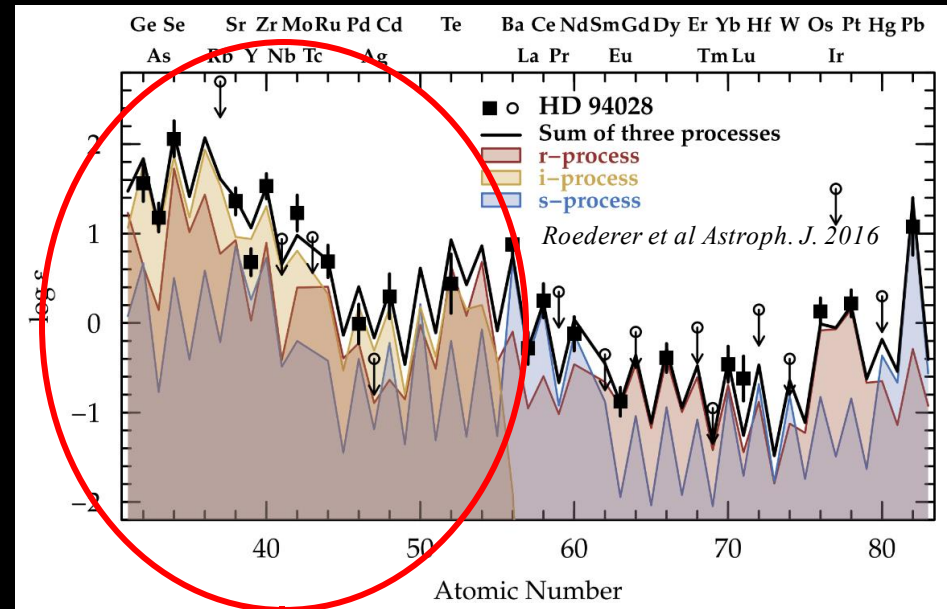

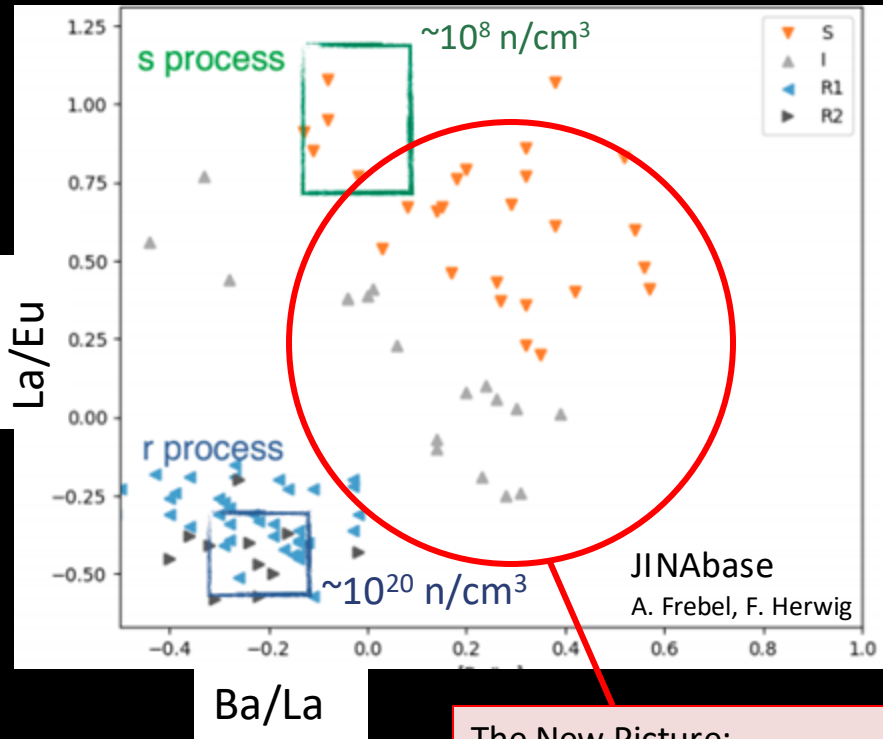

- Half by slow neutron capture (s-process)
 - In red giant stars
- Half by rapid neutron capture (r-process)
 - Site?

2003 “Committee on the Physics of the Universe”:
11 Science Questions for the New Century:
- How were the elements from iron to uranium made

A New Picture of Nucleosynthesis – A Continuum (Zoo?) of Processes

Evidence from metal poor stars – fossils of chemical evolution
+ current understanding of nuclear physics

The New Picture:

- Continuum of neutron capture processes
slow (s), intermediate, rapid n-capture processes
- Independent weak r-process?
- vp-process?

→ Need nuclear physics to disentangle

A More Complex (complete?) Picture of the Origin of the “r-process” Elements is Emerging

Hydrogen ingestion in stars:
i-process

Rapidly Accreting White Dwarfs:
i-process

Periodic Table of the Elements

1 1A H	2 2A He	3 3A Li	4 4A Be	5 5A B	6 6A C	7 7A N	8 8A O	9 9A F	10 10A Ne	11 11A Na	12 12A Mg	13 13A Al	14 14A Si	15 15A P	16 16A S	17 17A Cl	18 18A Ar	19 19A K	20 20A Ca	21 1B Sc	22 2B Ti	23 3B V	24 4B Cr	25 5B Mn	26 6B Fe	27 7B Co	28 8B Ni	29 9B Cu	30 10B Zn	31 11B Ga	32 12B Ge	33 13B As	34 14B Se	35 15B Br	36 16B Kr	37 17B Rb	38 18B Sr	39 19B Y	40 20B Zr	41 21B Nb	42 22B Mo	43 23B Tc	44 24B Ru	45 25B Rh	46 26B Pd	47 27B Ag	48 28B Cd	49 29B In	50 30B Sn	51 31B Sb	52 32B Te	53 33B I	54 34B Xe	55 35B Cs	56 36B Ba	57 37B La	58 38B Ce	59 39B Pr	60 40B Nd	61 41B Pm	62 42B Sm	63 43B Eu	64 44B Gd	65 45B Tb	66 46B Dy	67 47B Ho	68 48B Er	69 49B Tm	70 50B Yb	71 51B Lu	72 52B Hf	73 53B Ta	74 54B W	75 55B Re	76 56B Os	77 57B Ir	78 58B Pt	79 59B Au	80 60B Hg	81 61B Tl	82 62B Pb	83 63B Bi	84 64B Po	85 65B At	86 66B Rn	87 67B Fr	88 68B Ra	89-103 Lanthanide Series	104-110 Actinide Series	111 Uuq	112 Uuq	113 Uuq	114 Uuq	115 Uuq	116 Uuq	117 Uuq	118 Uuq

Organized by JINA, IReNA Partner Networks

- 579 participants JINA Horizon Meeting December 2020
- White Paper: 165 co-authors from 20 countries
- Includes:
 - Scientific vision for the field
 - DEIA vision for the field
 - Needs of early career scientists
 - Role of interdisciplinary centers and networks and the importance of collaboration
- Currently being refereed – available for scientists on arXiv

Facility for Rare Isotope Beams (FRIB) Provides New Opportunities for Nuclear Astrophysics

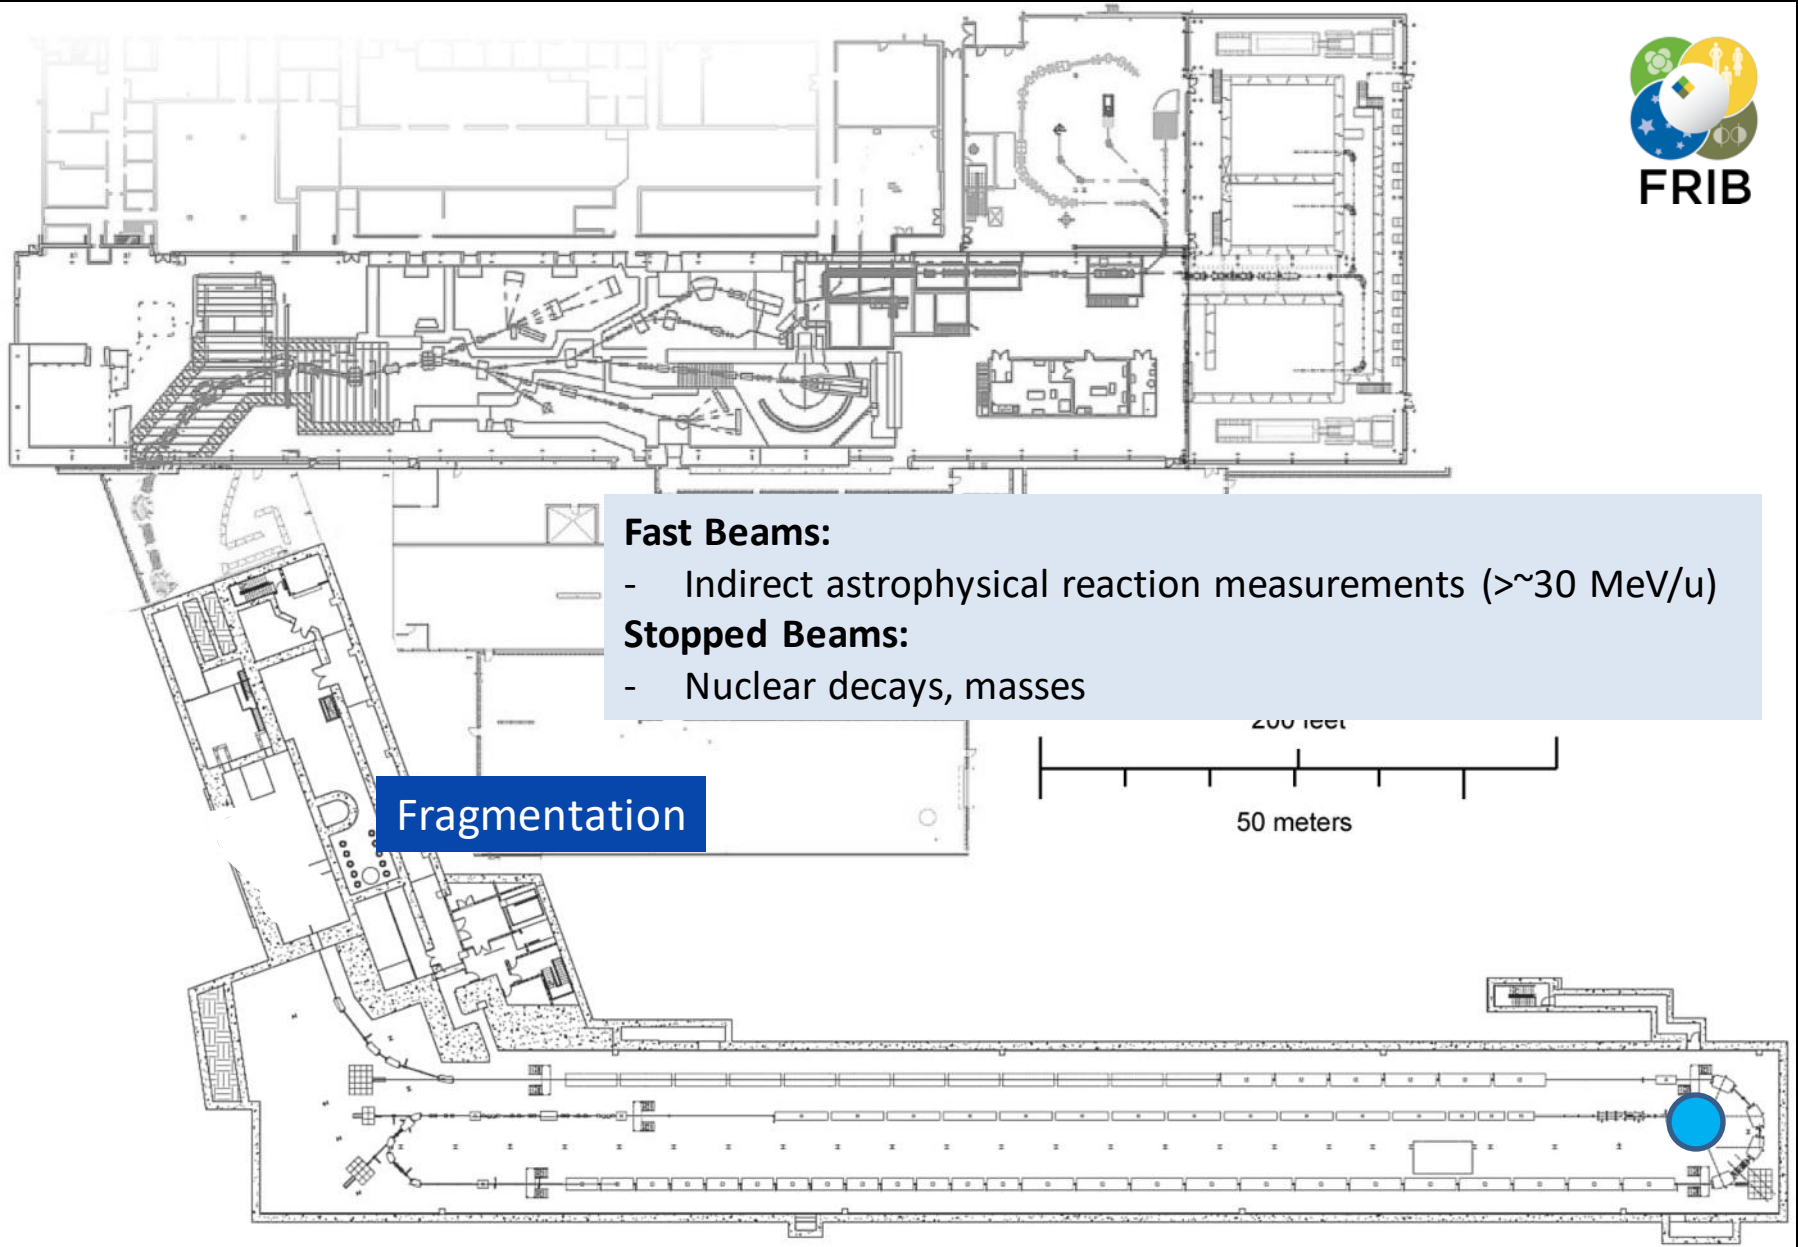

- FRIB is a \$730 million scientific user facility funded by the Department of Energy Office of Science (DOE-SC), Michigan State University, and the State of Michigan and located at Michigan State University in the US
- First FRIB experiments have begun in May 2022
- Unique opportunities for Nuclear Astrophysics

Facility for Rare Isotope Beams
U.S. Department of Energy Office of Science
Michigan State University

FRIB Provides Fast, Stopped, and Reaccelerated Beams

Fast Beams:

- Indirect astrophysical reaction measurements ($> \sim 30$ MeV/u)

Stopped Beams:

- Nuclear decays, masses

Fragmentation

200 feet

50 meters

FRIB Provides Fast, Stopped, and Reaccelerated Beams

ReA3 reaccelerated beams:

- Direct measurements of astrophysical reaction rates $< \sim 3$ MeV/u)
- Indirect measurements at low energy

ReA6 beams:

- Indirect measurements $\sim 3-6$ MeV/u

Reacceleration

to low astrophysical energies

Gas Stopping

Fast Beams:

- Indirect astrophysical reaction measurements ($> \sim 30$ MeV/u)

Stopped Beams:

- Nuclear decays, masses

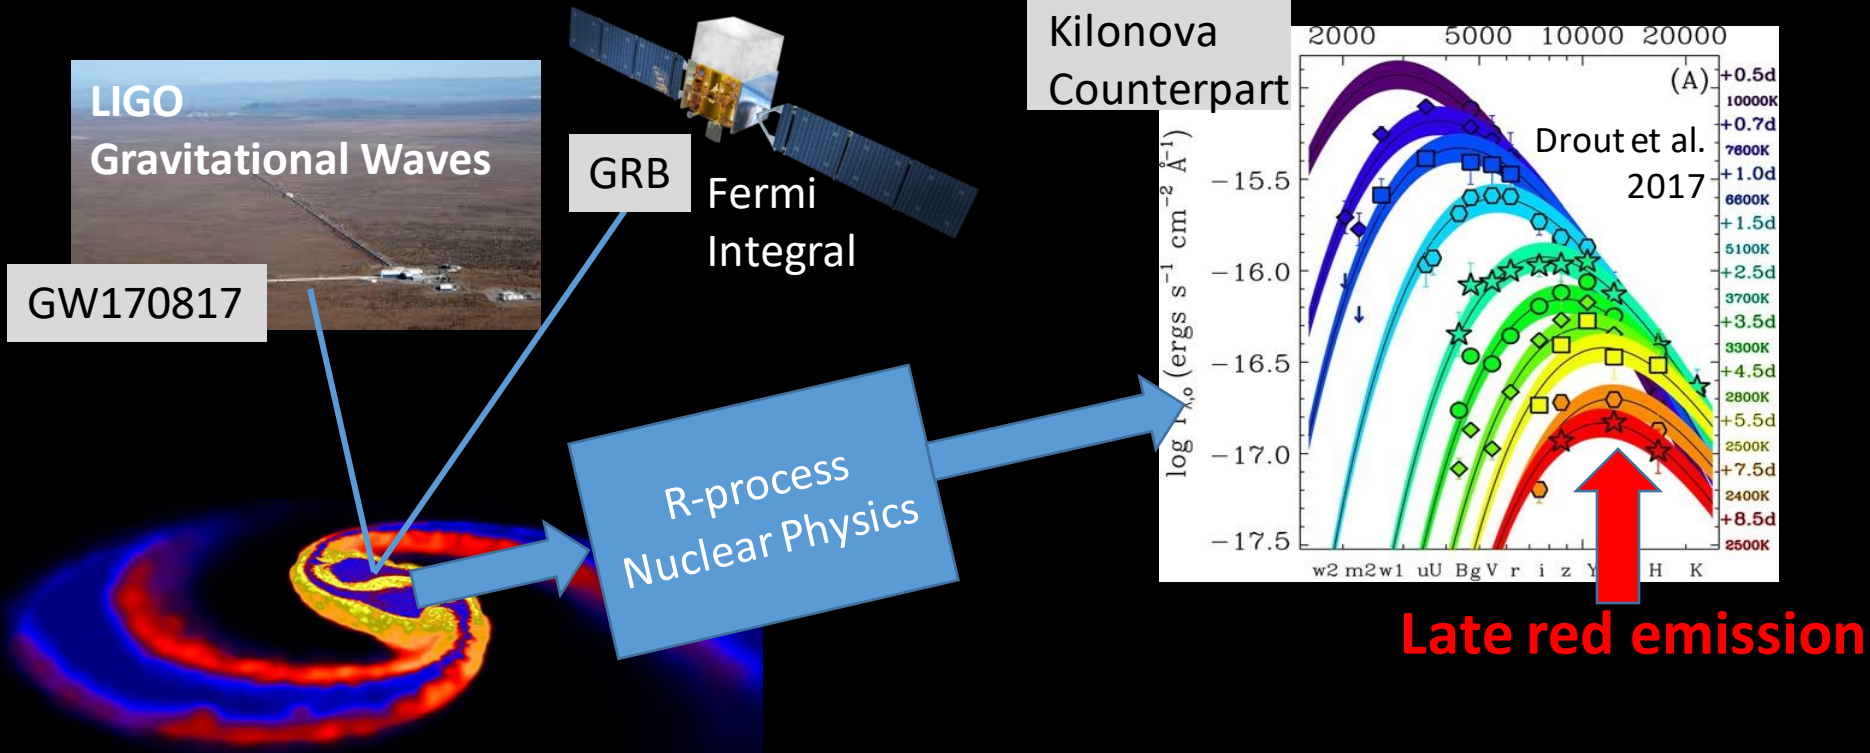

Fragmentation

ReA Standalone Capability:

- ReA3 accelerator can run in parallel with FRIB LINAC
- Batchmode ion source for long lived (10+ days) radioactive beams available (also from FRIB harvesting)
- Beams so far: ${}^7\text{Be}$, ${}^{10}\text{Be}$, ${}^{32}\text{Si}$, and ${}^{26}\text{Al}$

Are Neutron Star Mergers the Site of the Main R-process?

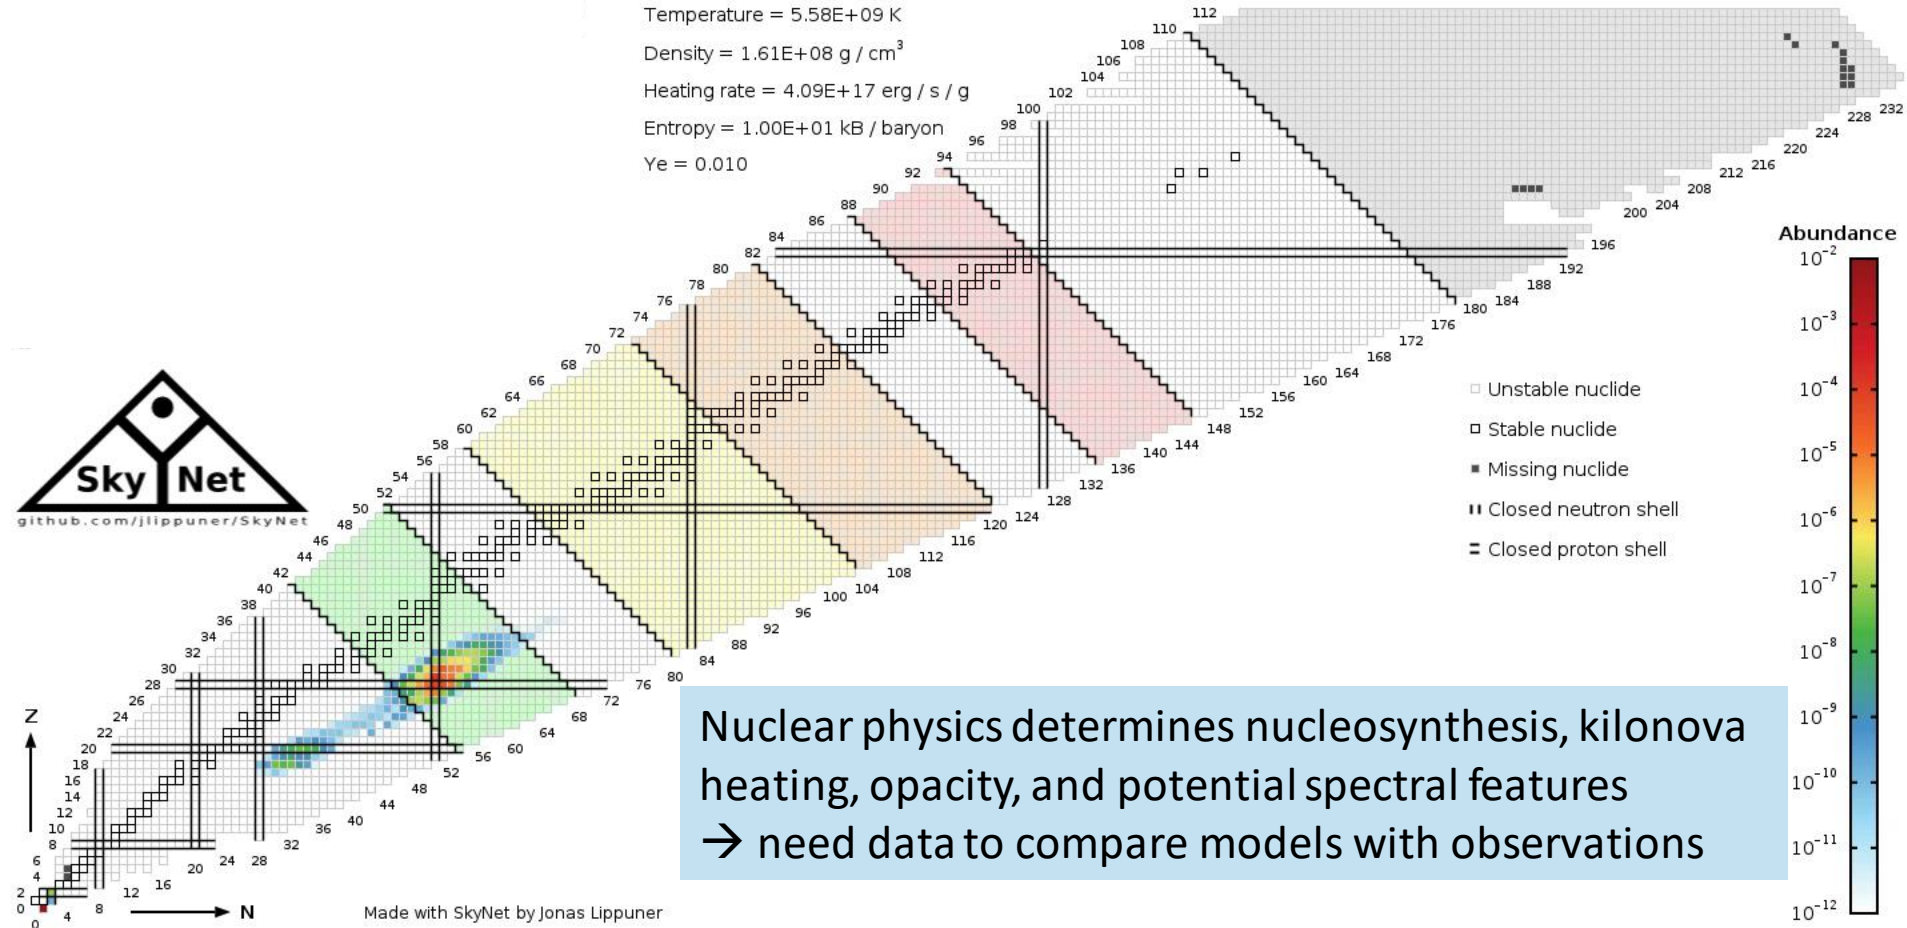

Direct Evidence for synthesis and ejection of large amounts of heavy elements

Open nucleosynthesis questions:

- What elements do NS mergers make?
 - Are NS mergers the only source of r-process elements? (Probably not)
 - What do observed heavy element features tell us about the engine and dense matter?
- All these require nuclear physics

Models Identify r-process Nuclear Physics

Temperature = 5.58×10^9 K
Density = 1.61×10^8 g / cm³
Heating rate = 4.09×10^{17} erg / s / g
Entropy = 1.00×10^1 kB / baryon
Ye = 0.010

Nuclear physics determines nucleosynthesis, kilonova heating, opacity, and potential spectral features
→ need data to compare models with observations

FRIB Will Address Reactions in Explosive Stellar Burning

Open Questions:

- What are the abundances of long-lived γ -ray emitters in supernova ejecta?
- What would observations with γ -ray observatories (e.g. future COSI) tell us about supernova physics?

Reaction	Impact	Isotope Affected
$^{42}\text{K}(n,\gamma)^{43}\text{K}$	4.18	^{43}K
$^{44}\text{Ti}(\alpha,p)^{47}\text{V}$	2.61, 1.31, 1.12 ^a	^{44}Ti , ^{48}V , ^{49}V
$^{43}\text{K}(p,n)^{43}\text{Ca}$	2.51	^{43}K
$^{59}\text{Cu}(p,\gamma)^{60}\text{Zn}$	2.16	^{59}Ni
$^{42}\text{K}(p,n)^{42}\text{Ca}$	2.13	^{43}K
$^{23}\text{Na}(\alpha,p)^{26}\text{Mg}$	2.12, 1.14, 1.13, 1.12 ^a	^{43}K , ^{47}Sc , ^{49}V , ^{55}Fe
$^{27}\text{Al}(\alpha,p)^{30}\text{Si}$	1.91, 1.58 ^a	^{43}K , ^{47}Sc
$^{28}\text{Al}(p,\alpha)^{25}\text{Mg}$	1.89, 1.37 ^a	^{43}K , ^{47}Sc

Key reactions for broad range of γ -ray emitters identified (Hermansen et al. 2020)

Reaction	Impact	Isotope Affected
$^{47}\text{Sc}(n,\gamma)^{48}\text{Sc}$	1.88	^{47}Sc
$^{47}\text{Ti}(n,p)^{47}\text{Sc}$	1.85	^{47}Sc
$^{48}\text{Cr}(\alpha,p)^{51}\text{Mn}$	1.84, 1.16 ^a	^{48}V , ^{51}Cr
$^{51}\text{Mn}(p,\gamma)^{52}\text{Fe}$	1.76	^{51}Cr
$^{41}\text{K}(p,\alpha)^{38}\text{Ar}$	1.72	^{43}K
$^{43}\text{K}(n,\gamma)^{44}\text{K}$	1.65	^{43}K
$^{46}\text{Sc}(n,\gamma)^{47}\text{Sc}$	1.55	^{47}Sc
$^{46}\text{Sc}(p,n)^{46}\text{Ti}$	1.45	^{47}Sc
$^{53}\text{Fe}(n,p)^{53}\text{Mn}$	1.41	^{53}Mn
$^{49}\text{Mn}(p,\gamma)^{50}\text{Fe}$	1.34	^{49}V
$^{55}\text{Co}(p,\gamma)^{56}\text{Ni}$	1.32	^{55}Fe
$^{45}\text{Ca}(n,\gamma)^{46}\text{Ca}$	1.31	^{47}Sc
$^{32}\text{S}(n,\alpha)^{29}\text{Si}$	1.31, 1.29 ^a	^{43}K , ^{47}Sc
$^{40}\text{Ar}(p,\gamma)^{41}\text{K}$	1.30	^{43}K

Broad range of reactions needed:

- Rare isotope beam experiments
 - Some beams sufficiently long-lived for batch mode production
- Stable beam experiments

→ Close collaboration between RIB and stable beam facilities needed

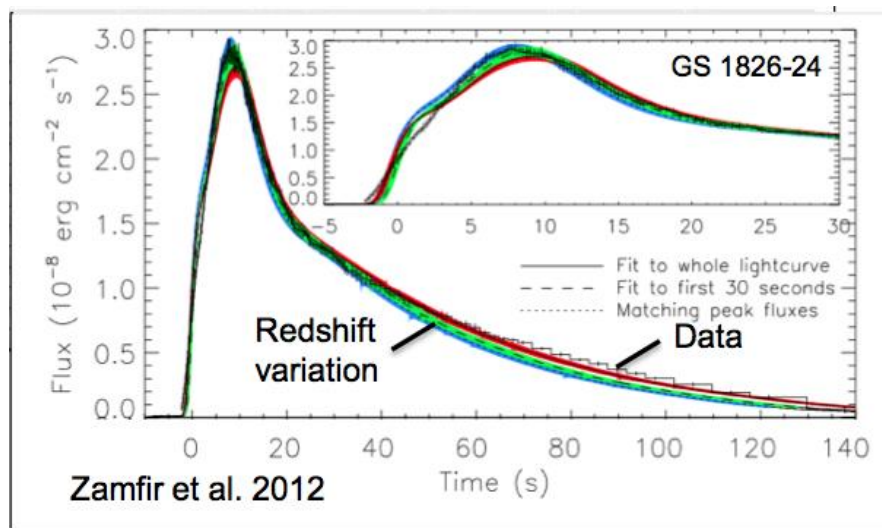

Accreting Neutron Stars are Unique Laboratories for Dense Matter

- X-rays from accreting neutron stars probe response of neutron star to accretion
- Complementary dense matter messenger to GW/EM signatures from NS mergers
- Opportunity with FRIB to pin down much of the nuclear physics
- New observations e.g. NICER, XRISM (launch date 2022) – key as not all data suitable for precision comparisons

Transition to Quantitative Analysis of Observations – Need Rare Isotope Nuclear Physics

Precision X-ray Burst Observations

- Model template comparison to extract surface red shift
- Constrains compactness of neutron star and equation of state

Recent progress on (α,p) reaction rates at NSCL

- Indications from indirect experimental data on nuclear excitation levels that (α,p) rates are currently overpredicted by theory factors of 100 or more (e.g. Matic et al. 2011)

AT-TPC: $^{22}\text{Mg}(\alpha,p)$

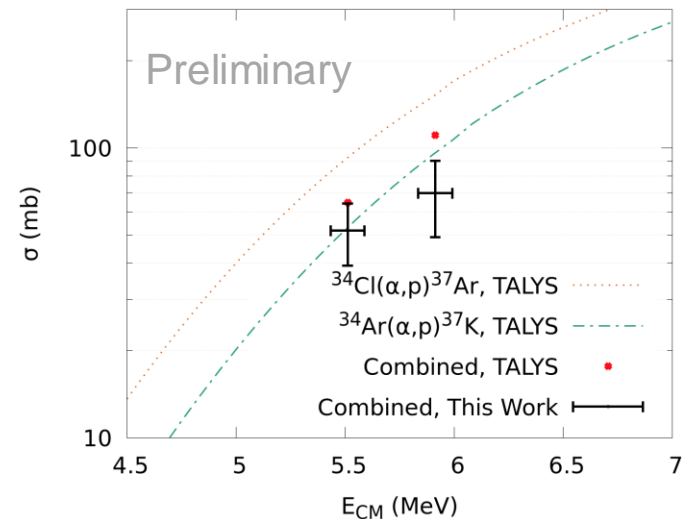

Randhawa 2020 @ NSCL AT-TPC

→ x8 lower than HF predictions

JENSA + ORRUBA $^{34}\text{Ar}(\alpha,p)$

Browne, Schmidt, Chippis et al. @ NSCL JENSA

→ Agreement with HF predictions within x2

- Factor of 100 overprediction by theory not confirmed
- Significant discrepancy with Hauser-Feshbach predictions in some cases
- More data needed, especially at lower energies, Gamow window for <1 GK not reached

Transiently Accreting Neutron Stars Provide Additional Observables that Depend on Rare Isotope Physics

- Decay measurements (FDSi/FDS)

→ EC transition strengths

Led by R. Zegers

Summary

- Confluence of advances in nuclear science, astronomy, computational science that creates unique opportunities for progress in nuclear astrophysics towards a theory of nucleosynthesis
- In Nuclear Science a new generation of rare isotope facilities and capabilities will be critical for nuclear astrophysics
- The breadth of the nuclear science facility landscape with complementary facilities for rare isotope beams, stable beams, neutron beams, gamma-beams is essential for nuclear astrophysics
 - Coordination and collaboration across all facilities is important
- Interdisciplinary coordination and collaboration with facilities and groups across nuclear science (experiment and theory), theoretical astrophysics, observational astronomy in its full breadth, gravitational wave physics, cosmo-chemistry is important
 - This requires special efforts to build the necessary scientific communities that do not necessarily interact with each other
 - The CeNAM collaboration and the IReNA network will be important to take full advantage of the extraordinary scientific opportunities in this area
